The Strawberry Valley Project in Utah takes approximately 160,000 acre feet of water from the Strawberry River and tributaries of the Green River (Colorado River drainage), stores the same in a reservoir and carries the same through a tunnel 19,100 feet long, to the Spanish Fork River for use upon lands in that drainage. Strawberry River is of the Gulf of California drainage, while the Spanish Fork River is a stream in the great basin of Utah and ultimately discharges into the great Salt Lake, which has no outlet. (1483-4, 3603.)

Defendants' Exhibit 43 is a sketch map showing the Strawberry Valley Project and the general relation of the tunnel and diversion with respect to the Colorado River and also with respect to the interior basin of Utah. The Jordan River connects Utah Lake, shown on the sketch, with Great Salt Lake. Water diverted from the Strawberry River and the Gulf of California drainage into the Jordan River and the Salt Lake drainage will not go down Strawberry River and will not return to that stream, but must be finally evaporated in the interior basin. This case is more extreme in its nature than the diversion of water from one tributary to another tributary of the same stream. (1485.)

The Milk River project, a portion of which is called the St. Mary Project, also involves an inter-watershed diversion. It is located in northern Montana. The St. Mary is considered as a supplementary part of the Milk River Project. St. Mary River is a tributary of the Saskatchewan and is a part of the Hudson Bay drainage. The water from this stream is diverted into Milk River, which is a branch of the Missouri, hence the diversion is, in effect, one from the Hudson Bay drainage in Canada to the Gulf of Mexico drainage in the United States. It is almost opposite in character of diversion from that shown on Exhibit 37, but evidences the fact that both Canada and the United States are willing to transfer water across divides in the same way. Sketch map, *Defendants' Exhibit 44*, shows St. Mary or Milk River project and other facts concerning the proposed diversion. The diversion is another example of the same principle involved in the Strawberry River project. It is not only from one watershed to another, but from one ocean to another. (1485-6.)

The Truckee-Carson project diverts water from the Truckee River near Wadsworth, Nevada, and carries it to the Carson River drainage basin. The *entire flow of the Truckee River* has been diverted into the Carson River basin for irrigation, so that there is *no water* running into Pyramid Lake. (3604-15, 3905.)

The Uncompahgre project in Colorado diverts water through the divide between the Gunnison and Uncompahgre Rivers by means of a tunnel some six miles in length. The water is diverted from the former for application upon lands situate along the latter stream. (1487.)

(5) SEVERAL STATES OF THE UNITED STATES.

There are many notable examples of inter-watershed diversions in the several states of the arid region and particularly in California, Utah, Montana, Idaho, Nevada, Oregon and in both Colorado and Wyoming.

(a) *California.*

The Los Angeles aqueduct is the most notable example in California. It has been built under public auspices and carries water for a distance of 250 miles from the Great Basin across two watersheds and finally delivers on the Pacific coast drainage. It diverts water from Owen River on the east side of the Sierra Nevada Mountains and conveys the same across this range of mountains, across the head of the San Joaquin Valley and across a second range of mountains known as the Sierra Madre or Tehachape Mountains. This diversion from the Nevada or Great Basin drainage for use upon the Pacific Ocean drainage is authorized in connection with the City of Los Angeles, which required water for domestic, irrigation, power and other purposes. Like all other similar diversions, the obtaining of water from this remote source was a matter of necessity. They not only divert the water of Owen River, but intercept a number of intermediate streams, so that the final carrying capacity is about 900 cubic feet per second. The right of the City of Los Angeles to construct this enormous enterprise, costing in the neighborhood of $25,000,000, has not been questioned. (1488-9, 3614.) (See sketch map, *Defendants' Exhibit 45.*)

The Hetch-Hetchy Project is another California project in process of construction for supplying water to San Francisco. Although San Francisco has been using water from a foreign watershed for a number of years, under pressure of need, they have been compelled to go into the Sierra Nevadas and obtain water from the Yosemite basin. This they intercept and carry across the divide and down to San Francisco. (1489.)

The notable features of the two California inter-watershed diversions just mentioned are the cost and magnitude of the enterprises, and, also, that they are contrary to the accredited riparian custom of that state, showing that necessity has forced them to practice this method.

The Truckee-Carson project already mentioned also involves inter-watershed diversion by the United States Reclama-

tion Service of water arising in California. Lake Tahoe lies across the boundary between California and Nevada. Nearly all its watershed is in California, as is also the Truckee River, its outlet which flows into Nevada and terminates in Pyramid Lake. The Reclamation Service is diverting the entire flow into the Carson River for irrigation under the Truckee-Carson project, so that in 1913 no water was running into Pyramid Lake. (3615.)

(b) *Utah.*

There are numerous inter-watershed diversions in Utah. W. D. Beers, State Engineer, says:

> "Will state that it *is* permissible in this state to divert water from one main drainage area into another and also from the watershed of one stream into the watershed of another stream when both are tributary to the same drainage area. * * * We have no diversions across the Continental Divide in this state." (3600-1.)

In a later letter, the same authority states:

> "Regarding the diversions of water from tributary streams where water is carried into the watershed of other streams of the same general drainage area, will state that such diversions are quite numerous in this state."

According to the same authority, there are nine diversions from one main drainage area to another, as shown by the records in the State Engineer's office at Salt Lake City, Utah, either constructed, in process of construction, or proposed. (Beers, 3602-3.)

The Strawberry Valley project of the United States Reclamation Service has already been mentioned, diverting 160,000 acre feet from the Strawberry River of the Gulf of California drainage over to the Spanish Fork River in the Salt Lake drainage. This is probably the most notable of the Utah diversions. (3603.)

The Burt and Carkquish Project for the diversion of 60,000 acre feet of water from Weber River drainage area across the divide into the Provo River drainage is probably the next largest diversion from one main drainage to another in Utah. (Beers, 3603.)

According to State Engineer Beers (3603), there are also diversions of like character as follows: The Timpanogas Irrigation Company project diverting water from Shingle and

Beaver Creeks of the Weber River drainage across the divide into the Provo or Utah Lake drainage;

The Murdock diversion from Beaver Creek across the divide into the Utah Lake drainage;

The Johnson diversion from the Joes Valley branch of the Green River across the divide to Ephraim Creek of the Sevier River drainage;

The Cutler project, diverting water from Weber River drainage across the divide into the Provo River drainage.

Porter project diverting water from Swaine Creek of the Sevier River drainage (which stream terminates in the Sevier Lake in the Great basin) over the divide into Kenab Creek of the Colorado River drainage. (3603.)

(c) *Montana.*

The Milk River project of the United States Reclamation Service is probably the most notable Montana project involving diversion of water from one main drainage area across the divide for application upon lands in another drainage area. In this case, the diversion is from the Hudson Bay drainage into the Missouri River or Gulf of Mexico drainage. (1485-6.)

A portion of the water supply of Butte is pumped from Big Hole River, a tributary of the Missouri, across the Continental Divide to Butte, which is on the Pacific slope. (3614.)

There is also a diversion between Montana and Idaho. (1487.)

(d) *Idaho.*

F. P. King, State Engineer of Idaho, states as follows:

> "I cannot recall for purpose of identification, the numbers of permits involving a transfer of water from one shed to another, but know that such action has been taken *repeatedly without question.*" (3609.)

(e) *Nevada.*

Inter-watershed diversions are common in Nevada. The Continental Divide does not affect Nevada, hence there are no diversions of that class. (3604.)

The most notable diversion is the Truckee-Carson canal of the United States Reclamation Service, already referred to, carrying water from the Truckee River to the Carson River drainage basin. (3604, 3615.)

Other small inter-watershed diversions constructed years ago occur from the drainage basin of the Truckee River. The Carson and Tahoe Lumber & Fluming Company diverted water from the drainage basin directly to Lake Tahoe and discharged

it into the Carson River drainage basin. Lake Tahoe is the head of the Truckee River.

The Virginia City Water Company are now diverting water from Marlette Lake and its tributaries, within the Truckee drainage basin above Lake Tahoe, to Virginia City, discharging the surplus into the Carson River drainage basin.

There are old ditches diverting water from the Walker River drainage basin into the Churchill Valley, eventually discharging into the Carson River basin. (3604-5.)

(f) *Oregon.*

In Oregon there is a ditch which has been constructed for a number of years, taking water from the upper tributaries of Burnt River and carrying the same across the divide into Willow Creek, which is a tributary of Matheur River. (3902.)

Professor Carpenter, speaking of inter-watershed diversions in Oregon, says:

> "There are other projects on Rogue River in southern Oregon. * * * Rogue River runs from southern Oregon into the Pacific Ocean. Kalamath River starts in Oregon and runs into California. There is one case where a ditch has already been completed carrying water from Kalamath basin into the Rogue River valley and there have been one or two others that are projected, surveyed, permits granted and some steps taken towards construction. There are two or three of these projects which are of considerable size.
>
> There is another known as the Teel Irrigation District in Umatilla County, Oregon. In this case they propose to take water from tributaries of John Day River, carrying it across the divide into Butter Creek and then to irrigate land with this water near the Umatilla Government project in Oregon. This enterprise is projected. It is in a state of suspense waiting for funds, but the permissions have been granted and everything is ready to take up construction upon obtaining of funds. I have maps of all these projects, but unfortunately have mislaid them." (3902-3.)

(6) COLORADO AND WYOMING.

Colorado and Wyoming are similarly situate. Their mountain ranges form the Continental Divide and from their slopes waters flow into the two great oceans. (2992.) Both states are in the arid region and their plains originally constituted a portion of the Great American Desert. In both of them the

climate is dry, with very limited rain-fall occurring at irregular intervals. Agriculture must depend almost altogether upon irrigation (1381-7), and, as we shall hereafter observe, in each state, from the earliest times, the rule of riparian rights has been abolished and the rule of appropriation in its broadest sense has been adopted.

We shall further observe that each state has universally recognized and approved the right of its appropriators to apply the water diverted from the streams upon lands requiring its benefit wherever the same may be located, without reference to the stream of origin.

The map, *Defendants' Exhibit 46*, prepared by Professor Carpenter, shows the states of Colorado, Wyoming and Montana and some of the territory in adjacent states and the courses of the streams whose inter-watershed diversions we shall hereafter particularly mention, and especially the Powder and Tongue Rivers as they rise in Wyoming, cross into Montana and join the Yellowstone, and the Laramie and Poudre Rivers as they rise and flow to join the North and South branches of the Platte River, which unite in Nebraska.

(a) *Colorado.*

Irrigation has been practiced in Colorado for a considerable time. In the Cache la Poudre Valley, the first irrigation on an extensive scale in the United States was practiced. Its conditions are quite advanced. Inter-watershed diversions are, and from the very first have been, quite common in this state. Whenever there was an available saddle or pass at an elevation not too great, and where there were streams flowing enough water to justify the expense, these diversions have taken place. They have been as essential to the reclamation of the lands as have been the construction of reservoirs or the exchange of water on streams. (Carpenter, 1490-3.)

The need of water for irrigation has caused inter-watershed diversions within the State of Colorado. Waters were first taken from the streams near by and subsequently from any other source of supply without discrimination. The same causes brought about the construction of these canals as led to the construction of canals of this character in France and India. (Carpenter, 1497.)

The diversion at the head of St. Vrain Creek across the divide and into the drainage of Left Hand Creek was one of the first to be made in Colorado. St. Vrain Creek rises on the Eastern slope of the Rocky Mountains near the summit of the Continental Divide and is a tributary of the South Platte River. Left Hand Creek is finally a tributary of the St. Vrain from the south. James Creek, a still smaller stream, takes its

rise between the St. Vrain and Left Hand Creek and makes a junction with the latter before it emerges from the foot-hills. Left Hand Creek and James Creek do not have a good natural water supply, and do not furnish sufficient water to irrigate the agricultural lands along the borders of Left Hand Creek upon the plains. In the early sixties certain settlers upon the plains along the valley of Left Hand Creek made appropriations of water from the stream for the irrigation of lands occupied by them. There was not enough water in the natural stream to supply their wants. At a certain point in the mountains, James Creek and the south fork of the St. Vrain are but a short distance apart. Taking advantage of this proximity of the two streams and channels, a ditch was cut through the narrow strip of land separating them. Thus water from St. Vrain Creek was carried over into James Creek and thence down the channel of that stream to Left Hand Creek and thence down Left Hand Creek and out upon the plains to supply the settlers with water for irrigation. This artificial channel was first constructed in 1863. By means of this inter-watershed ditch, the volume of water running in the channel of Left Hand Creek was more than doubled. An enlargement of this ditch was made in 1870, whereby the flow of Left Hand Creek was increased to about ten times its original size.

Subsequent appropriators upon St. Vrain Creek required the same water for use upon their lands that was diverted by the owners of the Left Hand Ditch and seized the water and destroyed the dams. The matter was then taken into court, and, as we shall observe hereafter, the diversion was approved by the Supreme Court in two decisions and by two different presiding justices. (See statement of facts and quotation from opinions in Coffin vs. Left Hand Ditch Co., 6 Colo., 443, and Oppenlander vs. Left Hand Ditch Co., 18 Colo., 142.) (Carpenter, 1496.)

Subsequent to the construction of the Left Hand Ditch, numerous other inter-watershed ditches were constructed in Colorado. These will be taken up more with regard to their location than the date of their construction. This class of diversions, as we shall hereafter observe, has been universally approved both by the statutes of the state and by the uniform decisions of its courts. A number of them are as follows:

The Cimarron Ditch takes water from Cimarron River over into Cow Creek and then delivers it into the Uncompahgre, which stream in turn delivers the water in the vicinity of Montrose and in the same neighborhood as the Gunnison tunnel project of the United States Reclamation Service. (1493.)

The West Cimarron ditch diverts water from West Cimarron River to the Uncompahgre and is similar to the Cimarron ditch. (1495.)

The Pine Ridge ditch is an old canal diverting water from the La Plata River to the Las Animas watershed. The La Plata is a tributary of the San Juan of the Colorado River drainage. This diversion is a case of diversion like the one at bar, from one tributary of the stream to another tributary of the same stream as both streams finally flow into the Colorado. (1494.)

The Overland ditch diverts water from Muddy Creek to Laroux Creek and the High Line Ditch diverts water from Surface Creek to Laroux Creek. (1495.)

Another ditch diverts water from Laroux Creek to a dry creek watershed and is another instance of the application of the general principle that where the physical conditions are appropriate, water is taken across the divide. (1495.)

The Montezuma Valley enterprise diverts water from the Dolores River by means of a tunnel into the Montezuma Valley, tributary to the San Juan River. Here again is a case almost identical with the case at bar, as it is between tributaries of the same principal stream. That ditch and tunnel were built in 1887 and have since been in operation. (1495, 1561.)

The City of Colorado Springs takes water from the south drainage of Pike's Peak, carries it through the divide in a tunnel over 6,000 feet in length and through a secondary tunnel about 700 feet in length and delivers it to the east drainage of the same peak. The south drainage of the peak is tributary to Beaver Creek, which flows into the Arkansas River near Florence, while the east drainage is into Fountain Creek, which enters the same stream near Pueblo. Thus the water is diverted from Beaver Creek across into the Fountain Creek drainage, where it is used by Colorado Springs for municipal, power and irrigation purposes. This is another example of diversion of water from one tributary for application on the watershed of another tributary of the same general stream. (1496.)

The City of Cripple Creek takes water from a branch of Beaver Creek, across the divide into Four Mile Creek. Both Beaver Creek and Four Mile Creek are tributaries of the Arkansas River stream system and here again is a case of diversion of water from one tributary to another. (1496.)

The Boulder Pass Ditch and other canals at the head of Boulder Creek and Clear Creek, tributaries of the Platte River (Atlantic drainage), divert water from Williams Fork, a tributary of Grand River (Pacific drainage). (1493-4.)

There are also several diversions planned at the head of Boulder Creek and Clear Creek whereby water will be diverted from Williams Fork and Frasier River, tributaries of the Grand River. Among these are the tunnel of the Henrylyn Irrigation District project and the tunnel proposed by the Moffat Railroad and the City and County of Denver. The

Henrylyn project is in process of construction. It proposes the diversion of water from Williams Fork, a tributary of the Grand River, for application on lands near Denver on the South Platte drainage. The Moffat tunnel enterprise also proposes to bring the water from the Pacific to the Atlantic side of the watershed, the water to be used for municipal and irrigation purposes. (1493, 1497-8.)

There is a canal diverting water from the Pacific drainage over into the Atlantic drainage at the head of the Arkansas River. (1496.)

A ditch on the head of Mosca, diverting water from Sand Creek, Rio Grande River drainage, carries water across the divide into the Huerfano River, Arkansas River drainage. This canal has been constructed for more than twenty-five years. (1496.)

At the head of the Cache la Poudre River, a number of important inter-watershed diversions have taken place in years past. These include the system here in controversy and are: Grand River, Michigan and Skyline Ditches of The Water Supply & Storage Company; Michigan Ditch of The North Poudre Irrigation Company; Divide and Wilson Supply ditch system, and the diversion by the Greeley-Poudre Irrigation District system made possible through its tunnel, collection ditches and reservoirs situate on the Laramie River. None of these diversions are for irrigation of lands within the watershed from which the diversion is made and in each instance the diversion is made from one stream for irrigation of lands situate within the drainage of another stream, the Cache la Poudre River.

The Cache la Poudre River, North Fork of the Grand River and the North Fork of the Platte River, with its tributary, the Laramie River, all rise in the same vicinity in Colorado. (1388.) In this vicinity the several ditches mentioned cross their several divides and convey water from the Grand and the North Platte drainage over into the Cache la Poudre or South Platte drainage. A comprehensive discussion of this area and the location of these several ditches is given by State Engineer Field. (1388-1400.)

Owing to the general development on the Cache la Poudre River, a shortage of water began to be felt in the early 80's, especially for irrigation of late and more valuable crops, such as potatoes, cabbage, sugar-beets, etc. The dependable supply of the stream having been exhausted, irrigators were compelled to look elsewhere and entered upon the construction of the trans-mountain or inter-watershed diversions. (1403-5.)

State Engineer Field (1404) thus described this class of diversions:

"The most difficult and expensive development undertaken is probably in the class of trans-mountain diversions. Here it is necessary to build canals in regions remote from labor, materials, and markets, through comparatively unoccupied territory and over lines where a large part of the work is through rock and along steep hillsides, where the seasons suitable for construction of canals are short and labor hard to obtain, where the most substantial construction is necessary, and where the utmost care must be exercised in the selection of the route and in the performance of the work. The ice and snow conditions of winter must be provided for and guarded against and tunnels of greater or less extent are generally necessary."

Of the Water Supply & Storage Company:

The Grand River Ditch diverts water from the north fork of the Grand River (Colorado River and Pacific drainage) across the Continental Divide and into the South Fork of the Cache la Poudre (Platte River and Atlantic drainage). The canal is about 7½ miles long and was commenced in 1888. It is over 10,000 feet above sea level and used for irrigation of lands in the Cache la Poudre River drainage, situate under the Larimer County Canal, which forms the south boundary of The Greeley-Poudre Irrigation District. (1396, 1443, 1492, 1880, 2204.)

The canal from Michigan Creek diverts from a tributary of the North Fork of the Platte River in North Park, Colorado, over Cameron Pass of the Medicine Bow Range of mountains at an elevation of about 10,200 feet, and into the Cache la Poudre River, for irrigation of the same lands in the Cache la Poudre drainage; (1492, 2204-5.)

The Sky Line Ditch of the same company diverts water from the head-waters of the Laramie River in Colorado. This is the stream here in controversy and this diversion is the first and earliest trans-mountain diversion made from the Laramie River in Colorado. The canal was commenced in 1891 and was completed in 1893. It carries about 130 cubic feet per second (2209) of water across a low pass in the Green Mountains at the point of juncture with the Medicine Bow Range and discharges into the Cache la Poudre drainage at Chambers Lake. It has been in constant use since 1893 and the waters so diverted and carried over the mountains are used for the irrigation of the same lands served by the Grand River and Michigan River ditches; (1405, 2205-13).

Laramie Lake and Lost Lake diversion by the same company carries water, naturally draining from those lakes into

the Laramie River over into Cache la Poudre River by means of a short ditch uniting those lakes with Chambers Lake. Laramie Lake and Lost Lake are situate almost at the top of the Green Mountains. (1492.)

The cost of none of these Water Supply & Storage Company's diversions in any manner compares with that of the Greeley-Poudre system. (1492.) All have been used constantly since their construction under claim of right by priority of appropriation and without objection from Wyoming or her citizens.

The degree to which the arid lands have been reclaimed through the Larimer County Canal with waters obtained from these trans-mountain or inter-watershed diversions, is best illustrated by the photographs contained in album, *Defendants' Exhibit 119.*

Another canal diverting water from Michigan Creek (North Platte drainage) across the Medicine Bow Range and into the Cache la Poudre (South Platte drainage) was constructed by The Mountain Supply Ditch Company, subsequent to construction of the Michigan River ditch of The Water Supply & Storage Company and is now owned by The North Poudre Irrigation Company. This canal furnishes part of the supply of the North Poudre system lying north of the Larimer County canal and west of the lands comprising the Greeley-Poudre Irrigation District.

The Divide Canal and Wilson Supply Ditch, working in combination as one system, were constructed for diversion of water from the upper reaches of Deadman and Sand Creeks, tributaries of the Laramie River, over the divide and into Sheep Creek, a tributary of the Cache la Poudre. This water is used to irrigate lands under the Larimer & Weld Canal in the Cache la Poudre drainage. The agricultural development of the Larimer & Weld area is elaborately illustrated by album, *Defendants' Exhibit 120.*

The Greeley-Poudre Irrigation District enterprise was commenced August 25, 1902, for diversion of additional waters from the Laramie River by means of tunnel and system of collection ditches and reservoirs. (1395-1402, 1935, 2039, 3933.) The tunnel by which the combined waters carried by the collection ditches and reservoirs on the Laramie are conveyed to the Cache la Poudre drainage, located and completed at the point where the Cache la Poudre turns from its theretofore parallel course with the Laramie and runs directly away from the course of the latter stream, needs no further description.

(b) *Wyoming.*

Wyoming is geographically quite similar to Colorado. The water supply in both states is wholly inadequate to supply the

vast areas of arid lands otherwise capable of reclamation. Irrigation is necessary in both states and inter-mountain diversions are as prevalent in Wyoming as in Colorado.

Professor Carpenter makes the following general statement:

> "Inter-mountain and inter-watershed diversions prevail in Wyoming. Wyoming is an arid state where irrigation is practiced under irrigation conditions and is therefore subject to the same general modes of action as other states and other countries.
>
> With Wyoming, as with Colorado, Italy, India and France, wherever there has been a locality developing which needed water, they have obtained water either from adjacent streams or *from available foreign watersheds.*
>
> There are quite a number of instances of this kind in Wyoming.
>
> These diversions have been recognized by the State of Wyoming by permits given by the officials in charge of irrigation.
>
> They have also been recognized by the Board of Control in giving adjudicated rights. Those adjudicated rights are similar to what we call water rights in this country" (referring to Colorado) "They are given by the Board of Control.
>
> In Colorado they are fixed by the courts.
>
> They are identically the same.
>
> Wyoming has officially recognized all of these transfers and use of water from one shed into another." (1503-4.)

He further says:

> "It is a fact that the complaining parties in this suit are doing the very thing of which they complain." (1514.)

The right of the appropriator to obtain his supply from any source, riparian, natural or foreign, has never been questioned in Wyoming, but, on the contrary, has been universally recognized and confirmed, especially by the quasi-judicial tribunals, the State Engineer and the Board of Control, by and through whom all of the water rights in that state are initiated, and, after construction, confirmed and decreed. The custom is there as universally accepted, recognized and confirmed as it is in the State of Colorado.

Professor L. G. Carpenter concludes his most remarkable and comprehensive testimony upon the question of inter-watershed diversions the world over by an extended discussion of

several of these Wyoming inter-watershed diversions, and we can do no better than quote from his testimony *in extenso*.

"The most marked instance is in northern Wyoming in the vicinity of Sheridan, which might be mentioned in detail and is very marked for a double reason, for its development has been to a greater degree than anywhere else and the marked conditions there have developed more than anywhere else I know of in the state.

In the first place, the land is at a low elevation, comparatively speaking, and that means that agriculture is more of an agricultural than of a grazing character, the land justifies higher prices and more extensive development. That is the first condition.

For a second reason, there also happen to be physical conditions near there encouraging the diversion of water quite readily at one particular place.

This has led to an extensive series of diversions from one watershed to another." (1503.)

"There happens to be a very convenient place for diversion between the Powder and Tongue River watersheds. There is a ridge of rock or rampart between the two sheds; but at one particular place it is broken so that there is a gap very much lower than the summit of the ridge. At the same place a tributary of the Powder River comes very close to the opening, so it required very little work to divert water through that opening.

On the north side, that is, the Tongue River side, the watercourse, a branch of the Prairie Dog, descends very rapidly, so that the country on the north side of that gap is lower than on the south side.

This gap has been a noticeable landmark in a sense, and so much so that the early travelers and wagon trains went through the gap and made it a point of crossing through this ridge.

That gives the physical conditions for these diversions.

Then, in addition to that, we have the relative fall of the land to the north and the relative early development of that same region, making additional water desirable. *Hence, it was the most natural thing in the world and a consequence of that same general principle, that they made a diversion through this gap.*

In doing this, they took water from North Piney Creek, which is a branch near the gap; but as the North Piney is not as good a stream as the South Piney, which is more or less east and to the south, they then, in addi-

tion, constructed feeding canals from the South Piney to the North Piney and bring water from the North Piney through this gap into the Prairie Dog Creek on the north watershed.

Prairie Dog Creek is used to some extent as a carrier of this water. They use both ditches and the Prairie Dog Creek for this purpose.

Permits and decrees were given for these diversions by the State Engineer and the Board of Control.

These permits are given to the waters of Piney Creek and the lands are described as lands along the Prairie Dog or other streams to the north.

These streams are tributaries of the Tongue River, they are part of the Tongue River system. The Piney is a part of the Powder stream system." (1508-9.)

"This particular place is the pioneer, almost, in Wyoming, for the two reasons already given, and also for the reason that the vicinity of Buffalo and Sheridan was one of the first in the state to become an agricultural community, hence those conditions developed there more than anywhere else in the state. When I speak of agricultural, I am distinguishing between that and what I call pastoral. I refer to the condition where cultivation of crops prevails.

The elevation of Sheridan is 3,750 feet, while the elevation at Laramie is over 7,000 feet, thus it makes that northern border of Wyoming a portion of the best agricultural section of the state from an economic standpoint.

There is a very extensive series of transfers of water from one watershed to another on the various tributaries of the Powder River which are south of Sheridan.

The ones I refer to as the most marked are those where water is transferred from a branch of the Powder River over into a branch of the Tongue River. *These two streams are entirely independent, both in Wyoming and Montana*, except as they physically mingle their waters after they enter the Yellowstone River.

The Powder River and the Tongue River in Wyoming are very similar in their general situation to the North Fork and the South Fork of the Platte River. These two streams are entirely separate in what might be called the parent state. After passing out of the parent state into another state, they then both enter into another stream and finally join their waters there.

In this case, the Tongue and Powder Rivers join their waters in the Yellowstone.

In the case of the Laramie and the Poudre Rivers,

they join their waters by the junction of the North and South Platte Rivers in Nebraska. *Both the Laramie River and the Poudre River are Colorado streams and their waters intermingle in another state.*"

"*The diversions at Sheridan, Wyoming, are exactly parallel to the diversions from the Laramie River to the Poudre River in Colorado.* The diversion from the Powder into the Tongue is made in Wyoming, while the two streams pass through another state.

I will speak of the diversions within the Powder River watershed before speaking of its diversion into the Tongue River watershed.

The Powder River watershed is just south of the Tongue River. In its watershed is the town of Buffalo and the irrigated section adjacent. Lake DeSmet is in that watershed. On the west side are the high mountains which supply these streams, and these streams, as a whole, are more abundant in the Powder River watershed than they are north of that tributary to Sheridan. *In these streams coming down from the watershed of the Powder River, there have been a large number of diversions from one stream to another.* For instance, there is a diversion from Clear Creek into French Creek, and from French Creek into the Johnson Creek. These streams I mentioned are tributaries of the Powder River. * * * I am taking the transfer of water from the watershed of one branch to that of another branch of the Powder River system. There is also found a diversion that passes from French Creek across Johnson Creek. We likewise have a diversion from Piney Creek on the north to Shell Creek on the south, and also from Rock Creek over to Shell Creek. There is also a place in the mountains some ten or twelve miles west of there where the South Piney Creek and Rock Creek come close together. This offers a convenient opportunity to divert water from the South Piney over into Rock Creek.

Such diversions have been practiced for years and *that whole irrigated tract is interlaced with the use of water from one stream to another.*

The decrees or adjudicated rights have been made from one stream to another according to the original source of supply, irrespective of the location of the lands.

These diversions I have described are all within the general Powder River watershed, which is the more southerly of the two streams, the Powder and the Tongue.

Exhibit 47 is a sketch map showing the stream system in northern Wyoming, both of the Tongue and the Powder Rivers. It shows these various points where

water crosses from one stream to another, *and these particular points are marked with a cross.* The land which it supplies by water through transfer is marked by crossed lines. The extent of these cross lines does not indicate very accurately the land itself, but indicates its location in a general way. It also shows the principal ditches by simply taking the outside or typical ones that cross the divide. It does not extend beyond the Montana border. In the corner, there is a map on a small scale that shows its relation to Montana and the Yellowstone River, showing the general situation on a very much reduced scale.

Exhibit 47 shows the various diversions I have just testified about, that is, those taking water from one portion of the Powder watershed to another." (1504-7.)

"I next refer to the diversions from the Powder River over into the Tongue River watershed. The rights to this water are given in the State records of Wyoming as classed in with the appropriations from Piney Creek, and except by looking up the specific lands, it would not be revealed that the water is carried across the shed. In this particular case, the list of lands that have thus acquired rights have been platted on the topographical sheet and are shown in color.

Exhibit 48 is a map prepared on the Sheridan Quadrangle Sheet of the U. S. Geological Survey, with additional notations made under my direction, and which show in color the lands on the Tongue River watershed that are supplied by water from Piney Creek of the Powder River watershed.

These are the lands to which water has been decreed by the Board of Control of the State of Wyoming. That body consists of the State Engineer and the Division Superintendents and is the official body of the state to issue decrees to water.

In addition, the divide between the two streams is noted by broken line in this map in heavier ink, so as to indicate clearly where that watershed is. The ditches are not indicated in my notations. They are shown on the map by a blue line, corresponding to the stream. There are three or four colors used which indicate the course given of respective ditches through this gap. The coloring was done by me. There is a legend on the map showing what each color signifies.

There are some diversions in the same general vicinity in addition to the diversions I have noted on this map, that is, * * * there are quite a number of diversions within the Tongue River drainage itself, similar in

character to those referred to within the Powder River watershed.

It simply is a general practice there, and the conditions as mentioned are very favorable to such diversions, and consequently they have done there as everywhere else on the earth's surface, when the occasion justified it. *They have carried water from one stream to another as freely as if no sheds were there, and the only conditions to be considered were physical and economical.* These on the map, are represented in like manner as in case of the Powder River system, by cross at the point where the principal diversions are made across the sheds. It is not an exhaustive list. There are others in the extreme north and west of this map that are not shown here.

I was compelled to check the lands as fixed by the Board of Control decrees in order to ascertain which of these diversions from Piney Creek and the Powder River tributaries were inter-watershed in their character. The published list of adjudicated rights, published by the State, simply tells the name of the ditch, for instance, the Prairie Dog or Supply Company and puts it under Piney Creek, but gives no indication as to where the land is located, and this requires a list of lands in detail, which are not included in the published list." (1511.)

At a later time in his testimony, Professor Carpenter thus further referred to these Sheridan diversions:

"I spoke of such diversions being made within Wyoming in the vicinity of Sheridan. * * * It seems there are ditches in Montana on both of these streams below the Montana line, that is, there are ditches in Montana after these streams run from Wyoming into Montana and before either of them joins the Yellowstone. There are also ditches in Wyoming. I ascertained those facts from county officials in Montana counties." (3905.)

Professor Carpenter further says:

"There are several other instances of inter-watershed diversions in Wyoming that I know of and undoubtedly there are many that are arising, because wherever the conditions justify, such diversions are the natural consequence.

The diversion by the Wheatland project out of the Laramie River, known as the Wyoming Development Company's diversion, *is an inter-watershed diversion.*

Water is taken from the Laramie River by a tunnel into Blue Grass Creek, thereby taking Laramie River water over into the Sybille watershed, which, in turn, is a tributary finally of the Laramie. This is a diversion from the main stream across into the shed of tributaries.

The difference between the diversion of the Wyoming Development Company and the diversion between the headwaters of the Poudre is one of degree only. The two streams come close together *and the diversions would undoubtedly have been made just as freely if the Sybille had not entered the Laramie at all.* It does enter the Laramie River, but I have no doubt from my knowledge of the mind of the people who developed the enterprise and the people who farm and need water, that those people would have diverted water just as quickly and just as freely, believing that it was perfectly right and proper, * * * whether the Blue Grass had gone into the Sybille and then into the Laramie or whether it had gone in the other direction. *In other words, it is just as natural to take water when available there as it is for a hungry man to search for food.*

Had the Wheatland people not made the inter-watershed diversion by means of the tunnel, they could not have developed the Wheatland area, except to a limited extent. That diversion has rendered the whole Wheatland tract possible from an agricultural standpoint. The only difference between the diversion at issue in this case * * * and the diversion from the Laramie to the Blue Grass is one of degree, and that the streams come together again quicker in one case than in the other. Had the Wyoming Development Company's tunnel not been constructed, the water of the Laramie River would have gone on into the North Platte.

The diversion by the Wyoming Development Company is recognized in Wyoming. * * * The courts and officials have recognized it, permits have been granted, the Board of Control has adjudicated it, and it is in the general list which has been subject to appeal, so that I think the final decree has not been entered. I am not aware of any objection having been raised to this diversion on account of its being inter-watershed in character. I have never heard any suggestion." (1511-13.)

An examination of Plaintiff's Exhibit N will reveal the fact that the District Court of Wyoming has officially recognized and decreed this inter-watershed diversion for the Wheatland project.

Professor Carpenter further says:

"There is a diversion under construction in Wyoming where water is proposed to be *taken from the North Platte River and brought over into the Little Laramie River*, * * * by The Laramie Water Company, which system includes Lake Hattie Reservoir. * * * Water is taken from Douglas Creek, a part of the North Platte system, and brought into the Little Laramie * * * and thus taken from the North Platte River to supply the Laramie River. * * * It runs from the Little Laramie into Lake Hattie by means of a supply canal tapping the Little Laramie. If the waters of Douglas Creek were not intercepted and were allowed to flow as of nature, they would go into the North Platte River and into the Pathfinder Reservoir.

This is the same ditch concerning which Mr. Bishop as engineer for the Laramie Water Company testified. It is the same ditch sometimes known as Douglas Creek Ditch and testified to by other engineers who were witnesses for Wyoming and were employees of The Laramie Water Company. (1513-14.)

"I have found several references and plans of proposed diversions from one stream to another where maps have been presented and referred to in the State Engineer's reports.

Exhibit 49 is a reproduction of sketch maps in the reports of the State Engineer of Wyoming, showing proposed diversions from one stream to another. There are three of them. * * * These three sketch maps shown in Exhibit 49 are all from the 7th Biennial Report of the State Engineer of Wyoming.

The one taken from page 40 represents the Encampment Canal in the Platte River drainage basin, and its proposed route crosses several other tributaries of the Platte River System.

From page 39 of the same 7th report, is a proposed Basin Canal from the Grey Bull River and crosses the divide between the Grey Bull and the Big Horn, passing over the divide and dropping into the Dry Cottonwood and supplying some of the valley in the vicinity of Basin.

There are several other minor canals shown, noting proposed developments that are not interstream.

On page 44 of the same report is also shown a diversion proposed from the Shoshone River across the divide into the watershed of the Grey Bull and there are some ditches taken from the Shoshone River to the north, running into minor watersheds.

There are probably a large number of inter-watershed or interstream diversions varying only in quantity and degree throughout Wyoming. I have not looked up all these places where conditions are favorable, but where conditions so favor they are apt to be found." (1515-16.)

Complainant objects to Colorado taking water *from* the *Laramie* River for use upon lands in the Cache la Poudre watershed. It would be indeed remarkable if it were discovered that for many years Wyoming has been taking water *from* the *Cache la Poudre* over *into the Laramie River* drainage, and that her right so to do has been adjudged and decreed by quasi-judicial tribunals having jurisdiction so to do. Nevertheless, such is the fact, and while the diversion is comparatively small, it nevertheless serves to confirm the fact that such diversions are not only legal but universal in Wyoming as well as in Colorado and that they are sanctioned by the courts of one state to the same degree as they are by those of the other.

Professor Carpenter says:

"I have ascertained that the appropriators of Wyoming divert water from the Poudre River over into the Laramie River. There is a case where water is diverted just in the contrary direction to that proposed by the State of Colorado through the Greeley-Poudre system. Water is diverted from a tributary of the Poudre River by systems in Wyoming over into a tributary of the Laramie area or from the Poudre watershed into the Laramie watershed.

This diversion takes place in Wyoming under the sanction of the laws and regulations of Wyoming. *It is done in accordance with the permit of the State and by the rights which have been passed on and adjudicated by the official Board of Control.*

Defendants' Exhibit 50 is a *map prepared by the State Engineer's office of Wyoming*, of a portion of Tp. 12, North, Range 73 West, the southern boundary of this portion being the state line between Colorado and Wyoming. This is one of a series of maps prepared by the State Engineer's office of Wyoming, showing ditches and streams from which ditches have been taken in that state for the purpose of record in their office. They have a series of such maps covering most of the state where ditches have been built and rights have been recognized.

This, then, that I present, is the official map from their office, except that for clearness in this case I have marked over the streams and ditches in color to make

it more distinct. The streams are designated with red and the ditches with yellow. This was done to make them clearer, for, as this is a blue print, the lines are not very clear.

The Johnson ditch crosses the divide from Fish Creek, *which is a branch of Dale Creek in the Poudre River watershed and over into Willow Creek drainage area, which is a part of the Laramie watershed. The Hill Ditch* also apparently crosses the divide and is not so clearly marked.

These diversions are all of minor character, compared with the larger ones of which I have spoken. They are small as to the amount of acreage, *but they involve the same principle.*

Fish Creek is a small stream running into Colorado but having a good many diversions from it in Wyoming." (1516-18.)

"Fish Creek is one of the several tributaries of Dale Creek which is one of the tributaries of the Poudre River. It has no large drainage area, but there are a number of decrees from it in Wyoming. It is actually a tributary of Dale Creek." (1577.)

"The diversion of water from the head of Fish Creek over into the Laramie River drainage in small quantities * * * is an injury to the Poudre Valley. All the water of the Poudre River, especially on Fish Creek, Dale Creek and the North Poudre, is and has been needed for years. It is particularly needed during the summer season. * * *

The difference between this diversion and a larger diversion is entirely a question of degree. This Fish Creek diversion simply illustrates the natural tendency to obtain water where the land is situate, so that it can be used and to derive the water from any adjacent or available source." (1595-6.)

Reduced to final analysis, a denial of the right of Colorado and her citizens to divert the waters of the Laramie River for irrigation of lands in the drainage area of the Cache la Poudre will be to declare that similar diversions are unlawful in Wyoming. So to do, would necessarily involve not only the Wheatland area, within the Sybille drainage and largely dependent upon the inter-watershed diversion from the Laramie and its Wheatland Reservoir No. 2, as well as other minor inter-watershed diversions within that drainage, but also the Sheridan area, within the Tongue River drainage and reclaimed with waters from the Powder River, and many other of the most highly developed agricultural districts of Wyoming. The Lar-

amie and Cache la Poudre are both within the Platte River drainage and the Powder and Tongue Rivers are both within that of the Yellowstone, and diversions from one greater tributary to another differ only in degree from diversions between minor streams going to form either of the larger tributaries, and to confine the use of water to the particular drainage of origin, be it large or small, must needs impair or render wholly valueless a considerable portion of the agricultural areas of both Colorado and Wyoming.

We cannot concur in advocating so destructive and revolutionary a doctrine.

Professor Carpenter, speaking generally of inter-watershed diversions, says:

> "I have covered a number of examples of inter-watershed diversions on both hemispheres, situate in several countries and several states of the United States. As I have before stated, they are illustrations of the fact that when water is needed for agriculture, they are going to, or are inclined to divert that water for that purpose whether it be from a stream adjacent or from a greater distance, and by a direct diversion or the intermediate use of reservoirs; *but in all cases, the diversion is actuated by the need and the opportunities to use that water. The fact of passing watersheds seems, in no case to be any more than a question of physical difficulty.* That is done as freely from one stream or a neighboring stream if the physical conditions permit and justify it. It has been recognized by practice and custom as a necessary thing to do. In each instance the object is to obtain water for irrigation of land, and in some cases for domestic use. Practically all the cases I have given have been for irrigation, at least that has been a very important part of the purpose. *There is no essential difference between the use of open ditches or tunnels for the purpose of making these inter-watershed diversions.* They are both means adapted to local conditions and accomplish the same general purpose. The selection of either of these means is merely an engineering problem." (1519.)
>
> "The preservation of waters in their natural watershed for a period of years ranging from a few years to a thousand years or more for the purpose of future development has never seemed to enter the calculation. I have seen no case where they have seemed to give that any thought, except in the consideration as to where the greatest benefit might be." (1593.)

No attempt was made by the State of Wyoming to controvert or deny the facts and conditions described in the foregoing

testimony of Professor Carpenter, and it therefore stands as admitted by the plaintiff that the same rule of necessity and opportunity now and always has governed all diversions in Wyoming, regardless of natural watersheds, to the same degree and effect as at every other place and in every other country where arid lands require the artificial application of water in order that they may be rendered the more productive, and that the more productive those lands prove to be, the more marked has become the actual construction of inter-watershed diversions.

Unfortunately, throughout all the arid countries of the world, there seems to be more available land than water supply, and in Wyoming, as elsewhere, the economic and financial problems of overcoming the physical obstacles have been the only problems standing between the construction of these inter-watershed diversions for the reclamation of arid lands. In Wyoming as in Colorado, the state has elected to abandon absolutely the doctrine of riparian rights and has adopted the rule of rights to the use of water from the streams within her borders by priority of appropriation, preference being given exclusively in the order of priority of the initiation of such diversions, if followed with continuity and beneficial use is made within reasonable time under all the circumstances surrounding the appropriation, and without the slightest regard to the physical location of the point of diversion and the lands to be served. Furthermore, Wyoming has carried this doctrine to the extreme limit by already officially adjudging and decreeing to her citizens waters arising within her borders but flowing southerly and into the Poudre River in Colorado for irrigation of lands situate across the natural divide and within the drainage area of the Laramie River and thereby has officially decreed and sanctioned that which she, in this case, condemns as illegal if done by the defendants.

CAUSES OF INTER-WATERSHED DIVERSIONS.

Professor Carpenter, who gave this subject most exhaustive consideration, in part said:

> "I have had occasion to observe diversions of water from one watershed to places of use upon another watershed the world over. It is practically a universal custom." (1445.)
>
> "These diversions have been prompted through the *need of water* in one watershed with the other watershed providing the most feasible and practicable way of obtaining water. It simply is one step in supplying the need. In some other cases, it has been also governed

by some or other additional considerations, as, for instance, the place of greatest use.

If inter-watershed diversions had been prohibited in many instances I have observed, *it would have prevented the development of a great many communities and of millions of acres. It would have lessened the food production for quite a large number of the human race*, for, I think it is pretty well known, that practically *seven-eighths of the food of the human race is raised by irrigation.* This is not true of our Anglo-Saxon people, but of the people of the world as a whole it is true. So that immense areas would have remained idle and, as in India, the loss from death by famine would have been very much increased, in fact, some of these cases in India were forced for the prevention of famine.

The custom of using streams as natural carriers of water from one part of a system of works to another is as universal as the need. Whenever the stream is so situated and the land to be served is so situated that the stream is convenient for that purpose, it is done without limit. If the land is situated where the stream is not a convenient carrier, they bring it in another way." (1446.)

In speaking of this character of diversions in India, he concludes with the following remarks:

"These diversions are simply made whenever the conditions are favorable; if they have water they can get, they plan a diversion from it. * * *

In each of these cases I have specifically pointed out, had these inter-mountain or inter-watershed diversions been prohibited, it would have meant the loss of millions of lives by famine in India. In fact, many of these canals and diversions have been taken up as a result of a report of the Famine Commission of India about 1898, I think, that suggested some of them, but by no means all.

They are entirely a result of the natural growth and development of the region.

Decidedly larger areas are made productive by this method than would be otherwise. A great deal of the water would run to waste otherwise.

Necessity has produced the construction of most of these works.

I have looked through the government reports, * * * and I have never found any legal objection against these diversions because of their inter-watershed character. This class of diversions seems to be taken as

a matter of course, to which they seem to have no objection whatever. There seems to be no more objection presented to it than to taking from a stream within its own shed." (1457-8.)

Of the French diversions, he says:

"The general principles involved in the diversions in France are the same as the diversions in India to which I have referred. There is a difference in magnitude, but where the conditions call for the diversions they have done it. The diversions are the result of the same general conditions * * *.

If these diversions which I have mentioned had not been made in France, it would have made probable the loss of a great many lives at Marseilles, which has had in its past years a great loss of life from lack of water, and it would mean the failure or suspension of population east of Arles on those plains that now are very easily supported by this water, and so it is in the vicinity of Avignon." (1463.)

Of the canal of Nimes, he says:

"It is not a very large one in capacity, but still it illustrates the same facts, that they are inclined to build a canal under the pressure of need and without any thought where the water comes from as far as that is concerned or where it is applied." (1466.)

He further says:

"I have failed to find any objection ever presented in France to this manner of diversion and application of water in any of the descriptions of canals, projects, or in any literature on that subject that I have seen." (1472.)

In speaking of the Italian irrigation, he says:

"These illustrate the general principle shown by those already given, that they take water freely from any stream that may be available.

I have failed to find any objections ever presented to any such manner of diversion and application of water in Italy. I have looked through the government reports and other literature of all kinds, some, by the way, running back to the fifteenth and sixteenth centuries, in a series of authors on water in Italy, and in no case has any reference to objection on any such score been made that I have found." (1472.)

With regard to Spain, he says:

"I know of no objection having been raised to such diversions. I do not think there could have been any, because the practice has gone on so generally." (1474.)

Of diversions in Hindustan, he says:

"I know of no rule governing these inter-watershed diversions except the same rule that has been evidenced elsewhere, that where water is available and land was needing water, it was taken without any regard to divides or considering any more than the physical obstacles that needed to be overcome as to the water of the stream itself. It was a mere physical difficulty." (1475.)

In speaking of such diversions in British Columbia:

"In a number of cases I found permits of this character that planned the diversion of water from one stream to another. The physical conditions seem to entirely control in these cases.

As a member of the Irrigation Commission, I did not raise any objection whatever. In fact, the laws as they were, permitted it, and the laws as passed did not forbid it.

It was considered one of the essential conditions to the development in an irrigated country, so it was left entirely permissible." (1478.)

In speaking of the various states:

"There are many notable examples of inter-watershed diversions in the several states. There are numerous cases in Colorado and Wyoming. There is one between Montana and Idaho, and, in fact, in nearly all of these states wherever the conditions require it.

Whenever it becomes necessary and feasible to bring water across the divide, wherever they have land on one side and find water on the other side of the divide, then they make the diversion." (1487.)

"I have not made detailed investigations of many of the other states. As I have previously stated, the conditions under which such diversions take place indicate that there has a certain development taken place. It has reached such a point that the local supply of water, if not exhausted, is at least so that the conditions justify their going some distance for water. This is an economic condition. When a state is just developing, they cannot afford to go too far for water,

especially when they can get it near by. Extreme conditions warrant the expenditure of larger sums of money to accomplish the irrigation of larger acreages. This occurs as the country becomes developed." (1490.)

Toward the close of the testimony, he says:

"They are simply illustrative of the *same general rule* that I have been attempting to show to be *universally true*, which is, that whenever there is an occasion to use the water, *whenever there is a need of water, people are going to obtain it from the stream that is nearest to them* or the stream that is most accessible physically and financially and, *whether a divide stands in the way or not, does not cut any figure*, any more than it requires more capital. * * *

I have found cases of physical and possibly financial obstacles, but that has been all. There has been no difficulty or opposition from the fact that water was taken across the divide." (3901-2.)

Referring to the Hawaiian Islands, he says:

"It shows again that where water was needed and they have conditions that justify the expense, the construction is completed." (3904.)

Referring to the Truckee-Carson diversion of the United States Reclamation Service, he says:

"In fact in one of these transfers the water is taken from a stream that runs normally into one basin or sink, over into a stream or watershed which runs into another and entirely different basin or sink. That is done by authority of the U. S. Reclamation Service and in those, as in other cases, where divides have been matters that have come in connection with these enterprises, they have not been considered as a different condition and water has been carried across them as freely as across minor divides or ridges.

They have carried the water in this case just the same as they have in the case of the Strawberry project and the Gunnison project. * * *

In all those cases the water has been carried across the divide wherever the conditions justified it." (3894-5.)

Speaking further in regard to foreign countries, he says:

"In foreign countries there are a number of other

cases of inter-watershed diversions than those I noted. It is perfectly safe to assume that wherever conditions exist, such transfers of water will be found." (3906.)

"No doubt further search into the subject would develop information concerning large numbers of these inter-watershed diversions wherever proper conditions exist. Diversions of this kind will be found where water is needed on one side and where land is so valuable as to justify the expense.

Such diversions in such cases will be made just as naturally and just as much a matter of course as we know that a thirsty man will drink water." (3907.)

Inter-watershed diversions between tributaries of the same stream are in no essential manner different from those across continental divides. In discussing this phase of the case, Professor Carpenter says:

"This is done by the U. S. Reclamation Service and in those, as in other cases, where divides have been matters that have come in connection with these enterprises, they have not been considered as a different condition and water has been carried across them as freely as across minor divides or ridges." (3904.)

And again:

"From the standpoint of irrigation and development, *I see no difference*, unless it possibly be in degree, *between diversions from the watershed of drainage of one ocean into the watershed of drainage of another ocean*, or of a stream having no outlet, *and between tributaries of the same stream.* It is a condition that comes from a state of development and a state of need, and local conditions which either make it possible or impossible. Thus, at the head of the Big Thompson, diversion could only be made at great cost and so high up there would not be enough water obtained to justify the expense. At the head of Boulder Creek diversion could be made at a lower elevation and water caught and the expense justified, and the same in Wyoming where diversions can be made when conditions justify it." (1498.)

Mr. John E. Field, State Engineer of Colorado and for years an expert in irrigation matters for both the State of Colorado and the United States Government, says:

"In irrigated regions the custom is to go and get water where you can get it, whether it is from the same

watershed in which the land is situated or whether it is from some other watershed.

Inter-watershed diversions are made where necessity arises that will justify construction. As a rule, they are decidedly more expensive than intra-watershed diversions. As a rule the only obstacle is that of expense. Wherever there begins to be a water shortage, the irrigators or those desiring to build ditches or desiring to increase efficiency of their systems, look for other water supplies, and this search for additional water carries them into other watersheds, and, if not too expensive, these diversions are made.

The future needs of the district from which the water is taken are never considered. Projectors of inter-watershed diversions simply ascertain whether there is any water there sufficient for them. *Their necessities have come earlier than those in the drainage area itself and are supplied first, and they take their water in order of priority, regardless of whether it is to be used in the same watershed or in a different watershed."* (3596.)

As illustrative of the principle which the record in this case bears out, it might be permissible to refer for the moment to Prescott's "History of the Conquest of Peru," Volume 1, pages 131-2, where the author thus describes irrigation of the ancient Peruvians:

"Much of the country along the sea-coast suffered from want of water, as little or no rain fell there, and the few streams, in their short and hurried course from the mountains, exerted only a very limited influence on the wide extent of territory. The soil, it is true, was, for the most part, sandy and sterile; but many places were capable of being reclaimed, and, indeed, needed only to be properly irrigated to be susceptible of extraordinary production. To these spots water was conveyed by means of canals and subterraneous aqueducts, executed on a noble scale. They consisted of large slabs of freestone nicely fitted together without cement, and discharged a volume of water sufficient, by means of latent ducts or sluices, to moisten the lands in the lower level, through which they passed. *Some of these aqueducts were of great length. One that traversed the district of Condesuyu measured between four and five hundred miles.* They were brought from some elevated lake or natural reservoir in the heart of the mountains, and were fed at intervals by other basins which lay in their route along the slopes of the Sierra. In this descent, *a passage was sometimes to be opened through rocks,—*

and this without the aid of iron tools; *impracticable mountains were to be turned; rivers and marshes to be crossed;* in short, the same obstacles were to be encountered as in the construction of their mighty roads. But the Peruvians seemed to take pleasure in wrestling with the difficulties of nature. * * *

Most of these beneficent works of the Incas were suffered to go to decay by their Spanish conquerors. In some spots, the waters are still left to flow in their silent, subterraneous channels, whose windings and whose sources have been alike unexplored. Others, though partially dilapidated, and closed up with rubbish and the rank vegetation of the soil, still betray their courses by occasional patches of fertility. Such are the remains in the valley of Nasca, a fruitful spot that lies between long tracts of desert; *where the ancient water-courses of the Incas,* measuring four or five feet in depth by three in width, and formed of large blocks of uncemented masonry, *are conducted from an unknown distance.*"

At page 134:

"With such patient toil did the Peruvians combat the formidable obstacles presented by the face of their country! Without the use of the tools or the machinery familiar to the European, each individual could have done little; but acting in large masses, and under a common direction, they were enabled by indefatigable perseverance to achieve results, to have attempted which might have filled even the European with dismay."

On page 137:

"Such were the expedients adopted by the Incas for the improvement of their territory; and, although imperfect, they must be allowed to show an acquaintance with the principles of agricultural science, that gives them some claim to the rank of a civilized people. Under their patient and discriminating culture, every inch of good soil was tasked to its greatest power of production; while the most unpromising spots were compelled to contribute something to the subsistence of the people. Everywhere the land teemed with evidence of agricultural wealth, from the smiling valleys along the coast to the terraced steeps of the Sierra, which, rising into pyramids of verdure, glowed with all the splendors of tropical vegetation."

And on page 364, he further describes irrigation works of the Incas:

> "The soil, though rarely watered by the rains of heaven, was naturally rich, and wherever it was refreshed with moisture, as on the margins of the streams, it was enamelled with the brightest verdure. The industry of the inhabitants, moreover, had turned these streams to the best account, and canals and aqueducts were seen crossing the low lands in all directions, and spreading over the country, like a vast network, diffusing fertility and beauty around them. The air was scented with the sweet odors of flowers, and everywhere the eye was refreshed by the sight of orchards laden with unknown fruits, and of fields waving with yellow grain and rich in luscious vegetables of every description that teem in the sunny clime of the equator. The Spaniards were among a people who had carried the refinements of husbandry to a greater extent than any yet found on the American continent; and, as they journeyed through this paradise of plenty, their condition formed a pleasing contrast to what they had before endured in the dreary wilderness of the mangroves."

That this description by the eminent historian was conservative, we need but refer to the learned article and especially the photo illustrations accompanying the same, recently prepared by O. F. Cook, Botanist of the National Geographic Society, and published in May, 1916 number (Vol. XXIX, No. 5, p. 474, et seq.) of The National Geographic Magazine under title of "Staircase Farms of the Ancients," wherein he says in part:

> "At a time when our ancestors in northern Europe were still utter savages, clothed only with skins, and living by hunting and fishing, settled agricultural communities must have existed in the Peruvian region. * * * Evèn irrigation agriculture appears to us as a new and very specialized branch of the art, and we think ourselves very enterprising to have undertaken the reclamation of our so-called deserts in the Western States. * * * The native agriculture of Peru reached the stage of reclamation projects long before America was discovered by Europeans. *Our undertakings sink into insignificance in the face of what this 'vanished' race accomplished.*"

The late Clesson S. Kinney, in his recent (1912) treatise on the law of "Irrigation and Water Rights" and the arid

region doctrine of appropriation of waters, Volume 1, gives the history of ancient and modern irrigation in a most elaborate and comprehensive manner on pages 101 to 127 inclusive. For illustration, of ancient irrigation in the arid west and the extremity to which *necessity* drove the ancient builders, he says:

> "One of the most marvelous engineering accomplishments of ancient or modern times is shown in discoveries which were made during the years of 1899 and 1900 in the lava beds of New Mexico. Hundreds of years ago, the geologists and archaeologists tell us, a system of irrigation reservoirs and ditches was operated in this Territory, which is not paralleled by anything of this nature in the United States today. The builders of these works, a people older than the Pueblo race, the native occupants of this section of the country, cultivated thousands of acres of now arid territory. Ditches wound in and out at the base of the mountain ranges, following the sinuosities of the larger canals in such a manner as to catch all the storm water before it was absorbed by the loose sand at the mountain's base. Reservoirs constructed at convenient places stored the water, from which it was led in cemented ditches across loose soil to the various points where it was required for irrigation. * * *
>
> That they were highly developed, however, in agriculture, which is the mother of civilization, is shown by the evidences which they have left.
>
> Their canals wind in and around for miles, showing a superior engineering knowledge in securing an exact and uniform fall; remarkable viaducts were used in crossing canyons, while a network of distributing ditches brought every available acre into use for tillage. Here was no irrigation by wandering tribes, or individual owners, or diverters of water; but a great system covering large areas, and by a people who were permanently settled in that region, carefully thought out and operated by a central head for the greatest good of the many and the utilization of the greatest possible acreage."
>
> Kinney on Irrigation (2nd Ed.), Vol. 1, p. 121.

And thus we find that *necessity* has universally caused inter-watershed diversions and that wherever agriculture, the "mother of civilization," has prevailed upon the face of this earth, it has been the universal custom through all the ages to supply the *needs* of thirsty land with water from any available source whether within or without the drainage area of the stream from which the diversion was made, and that natural

barriers have interposed no obstacles, other than physical, to such diversions, which have been made across the divides as freely and as naturally as within the watersheds. And we also find that both Colorado and Wyoming have been no exception to this general rule; that inter-watershed diversions have been made as freely, naturally and beneficially there as elsewhere; and that the only limitation *within* each state upon all diversions (intra- and inter-watershed) has been that he who is first in time shall forever be first in right as against all who shall claim from the same source *within his respective sovereign jurisdiction.*

THE LAW OF INTER-WATERSHED DIVERSIONS.

Will be treated as follows:

(a) *Riparian Rights.*
(b) *Arid Region Doctrine of Appropriation.*
(c) *Essential Differences Between Common Law and Appropriation Doctrines, Including Right to Make Inter-watershed Diversions.*
  (1) Colorado Constitution, Statutes and Decisions.
  (2) Wyoming Constitution, Statutes and Decisions.
  (3) Other Decisions and Authorities.
    (3-a) Hoge v. Eaton, Overruled.
(d) *Plaintiff's Brief.*
(e) *Conclusion.*

THE LAW OF INTER-WATERSHED DIVERSIONS.

In Volume I of this brief, we have discussed at length the law relative to the right of each sovereign state to regulate diversion and distribution of waters within her own borders in such manner as she may elect, including the right to change her doctrines or rules in such manner and as frequently as she may desire.

Kinney on Irrigation (2 Ed.) Vol. 1, p. 1025-29, 1088.

A preliminary discussion of the rights of appropriators in the arid regions of the United States, to divert the waters of one stream for carriage across the divide of the watershed and for application within the drainage area of another and foreign stream requires a brief consideration of the common law doctrine of riparian rights in order that we may distinguish the rights of water users under that doctrine from those claiming under the doctrine of appropriation, and for the further purpose of interpreting decisions of courts of certain of the states which have adopted the common law rule in its strict or modified sense. We shall frequently italicize for better emphasis.

(a) Riparian Rights.

In Great Britain and the humid states of the United States, where the climate is moist, the natural rain-fall abundant and the land supplied by numerous springs and flowing streams, irrigation is not required. There the concern of the farmer is how he may dispose of surplus water, already so abundantly supplied by nature, rather than how he may supply his crops with sufficient moisture to start the seed and promote their growth.

> "The problem there to be solved is how best to drain the water off the land and yet get rid of it, not how to save it to be conducted upon the land in aid of the husbandman."

In this humid region, *every proprietor of land* on the *banks* of natural streams has *equal rights* to have the water of the stream to flow "as it was wont to run" without diminution in quantity or deterioration of quality save as necessarily depleted by reasonable use thereof by himself and other riparian proprietors.

Long on Irrigation (2 Ed.) Sec. 31, page 66, and cases cited.

The common law doctrine of riparian rights is thus stated by Chancellor Kent:

> "*Every* proprietor of lands on the banks of a river has naturally an *equal* right to the use of the water which flows in the stream adjacent to his lands, as it was wont to run (*'currere solebat'*), without diminution or alteration. No proprietor has a right to use the water to the prejudice of other proprietors, above or below him, unless he has a prior right to divert it, or a title to some exclusive enjoyment. He has no property in the water itself, but a simple usufruct while it passes along. *'Aqua currit et debet currere ut currere solebat'* is the language

of the law. Though he may use the water while it runs over his land *as an incident to the land*, he cannot unreasonably detain it, or give it another direction, *and he must return it* to its original channel when it leaves his estate.

Without the consent of the adjoining proprietors, he cannot divert or diminish the quantity of water which would otherwise descend to the proprietors below. * * * This is the clear and settled doctrine on the subject, and all the difficulty that arises consists in the application. The owner must so use and apply the water as to work no material injury or annoyance to his neighbor below him, who has an *equal* right to the subsequent use of the same water; * * * All that the law requires of the party by or over whose land a stream passes is that he should use the water in a reasonable manner, and so as not to destroy, render useless or materially diminish or affect the application of the water by proprietors above or below on the stream."

Chancellor Kent, 3 Kent Com., 439.

Common law rights of riparian proprietors are such as grow out of or are connected with their ownership of the *banks* of streams and rivers, or other bodies of water. These rights are distinct from those of the rest of the public, by reason of the fact that the land of the riparian owner touches the water. They are termed natural rights and arise *ex jure naturae*, and are the natural advantages of the owner which spring from the natural situation of the land upon the water. The riparian owner has a right to make reasonable use of the water of the stream as it flows by his land, but his usufructuary right is *equal* with and no less nor greater than all that of *every other* riparian owner upon the same stream. Use by one riparian owner must be of such a character as not to destroy, render useless or materially diminish or affect every other proprietor on the stream in his equal right to the use of the same water. These property rights are part of the freehold of which no riparian owner can be disseized but by due process of law and upon a just compensation.

Kinney on Irrigation & Water Rights (2d Ed.), Vol. 1, pages 759-73, and cases cited.

Professor Long, in his very recent work, says:

"The right of a riparian proprietor to the use of the flow of the water of the stream is an inherent incident of his ownership of the riparian land; it is annexed to the soil, not as an easement or appurtenance, but as a

part and parcel of the land itself. As a part and parcel of the land it passes with the land upon the sale thereof although not specifically mentioned in the conveyance. * * * *It follows from the nature of the right that it is in no way dependent upon user. Use does not create the right and disuse cannot destroy or suspend it.* If the riparian proprietor does not care or need to use the water, he still has the right to have it flow in its accustomed channel, except as its volume may have been decreased by its reasonable use by upper proprietors. His right can be lost only by grant, condemnation or prescription."

Long on Irrigation (2d Ed.), pages 70-1, and cases cited.

Mr. Kinney is also authority to the effect that:

The land, to be riparian, must be under a common ownership. If the use for which the water is claimed, consumes the water, the extent of the land must be reasonable with reference to the lands of other proprietors whose lands are also riparian to the same stream, and

Under the rule of riparian rights so obtaining in humid regions (including, as we shall hereafter observe, the largely humid region on the Pacific coast), the lands must lie within the watershed of the stream in order to be riparian. He says:

"If lands * * * bordering upon a certain stream are divided by Nature, so that a portion of them are cut off and lie in another watershed, such lands are *not* riparian to such stream. They belong to the lands of the other watershed, and, in turn, may or may not be riparian to the stream which drains such watershed, depending, of course, as to whether or not they touch upon such stream. In such a case Nature has interposed a dividing line and has cut off such lands from the lands actually riparian to the stream by the ridge dividing the two watersheds. *This is just as effectual as though the common owner had cut off such lands* by conveying them to another person."

Kinney on Irrigation (2d Ed.), Vol. 1, pp. 782-3.

Under the riparian doctrine, the riparian owner

"May use the water while it runs over his land, as an incident to the land * * * and he must return it to its ordinary channel when it leaves his estate."

in order that *other riparian owners* (not appropriators), either

above or below him upon the stream, may not be deprived of an *equal right* to the use of the same water.

> "The principal reasons for the rule *confining riparian rights to that part of the lands bordering on the stream* which are within the watershed are that, where the water is used on such land it will, after such use, return to the stream."
>
> Long on Irrigation (2d Ed.), p. 95, and cases cited.

Mr. Wiel, in his recent work, devoted largely to advocacy of the California common-law doctrine of riparian rights, assigns the same reason for prohibiting use beyond the watershed in common-law states, viz.: That the water must return to the stream to supply the equal rights of other *riparian* land owners.

Thus it appears that in some jurisdictions under the common-law doctrine, the riparian owner is limited to the natural watershed of the stream in the use of its waters for the reasons: (1) That lands segregated by the divide are not riparian, and (2), that water carried beyond the divide cannot be returned to the stream for other riparian owners, each and all of whom have an *equal* right to the use of the water as it flows in the stream past their riparian lands.

It generally appears that, under the riparian doctrine, the use of water is limited and confined to riparian lands or lands which border upon the stream; that *all riparian* owners have the *same* natural and *equal right* to the use of the water of the stream, regardless of location on the stream or the dates of acquisition of title; the right is a part and parcel of the land and passes with the land upon sale; *use does not create and disuse cannot suspend or destroy the right;* the riparian owner is only entitled to the use of water as it passes along and the *equal rights of all* other riparian owners *prohibit exclusive use by any one* thereof; and each riparian owner must return the water to its ordinary channel when it leaves his estate in order that all other riparian proprietors may enjoy their equal right to the use thereof, and this, in turn, probably prohibits a diversion of any of the waters beyond their natural watershed, for, by so doing, the owner would be using the water upon non-riparian lands and could not return it to the stream.

The arid states have abrogated the common-law riparian doctrine in its entirety and have adopted the law of appropriation in lieu thereof. The doctrine of appropriation is in direct contrast with the common-law doctrine and differs, *inter alia*, in the following particulars:

Under the doctrine of appropriation, all rights are *necessarily unequal rather than equal*, and he who is first in time is

first in right, even to the extent of converting to his own and *exclusive beneficial use* the *entire flow* of the stream, if his necessities so require;

Beneficial use is the foundation of the right. It may be forfeited by non-user, and the physical situation of the land with relation to the stream bears no relation to the right, so vested, limited and perpetuated upon beneficial use;

The waters of the stream are the property of the public, the state, subject to appropriation in order of priority and beneficial use, and are not an incident to and part of the soil or the lands which, by accident, touch the stream;

The appropriator may change *both* the point of diversion and place of application, and *he has a property right in the water*, lawfully diverted to beneficial *use*, which he may sell and dispose of separate and apart from the land upon which the right ripened;

> Kinney on Irrigation (2d Ed.), Vol. 2, Secs. 768-9, pp. 1326-32.

He is under no obligation to return the water to the stream, and in the enjoyment of his *exclusive* (as contrasted with equal) right, his use is not limited to lands which are riparian to the stream, but he may apply the same on non-riparian lands within the drainage of the stream or "whithersoever necessity may require," including lands in other and foreign watersheds; and

His beneficial use to the extent of the necessities of his land, wherever situated, coupled with the time (priority) of such beneficial use, defines the extent and order of his right.

> Oppenlander vs. Left Hand Ditch Co., 18 Colo., 142, 148-9; 31 Pac., 854.

The common-law doctrine of riparian rights prevails in all the humid states and is the foundation of the so-called "California System" or doctrine which has generally been followed and adopted by Kansas, Montana, Nebraska, North Dakota, Oklahoma, Oregon, South Dakota, Texas and Washington.

> Long on Irrigation (2d Ed.), pp. 19-21.
> Kinney on Irrigation (2d Ed.), Vol. 2, p. 1103.

The doctrine of appropriation has been adopted and the common-law doctrine of riparian rights *abolished* in Colorado, Arizona, Idaho, Nevada, New Mexico, Utah and Wyoming. The doctrine of appropriation, in abrogation of and direct conflict with the common-law doctrine, as adopted in these states, is commonly known as the "Colorado doctrine," as distinguished

from the aforementioned "California doctrine," so founded upon the common-law theories.

Kinney on Irrigation (2d Ed.), Vol. 2, pages 1098-1124.

Long on Irrigation (2d Ed.), pages 19-63.

(b) Arid Region Doctrine of Appropriation.

We have already noted that in the states of the arid region, including Colorado and Wyoming, the common-law doctrine of riparian rights has been abolished and in lieu thereof these states have uniformly adopted the doctrine of acquisition of title to water by priority of appropriation for beneficial uses.

"The imperative and growing necessities" of the conditions prevailing in these arid states compelled the recognition and adoption of the law of prior appropriation, and each of the states, in the exercise of her sovereign right so to do, adopted the new doctrine and abrogated the old as unsuitable and wholly inapplicable to the conditions prevailing throughout the arid region.

Stowell vs. Johnson, 7 Utah, 215; 26 Pac., 290.
Kinney on Irrigation (2d Ed.), chap. 31, and cases cited.

Detailed consideration of the foregoing and the many other authorities in point would unnecessarily consume time of court and counsel, and the reason for the doctrine may be obtained by quoting from a few of the many available authorities.

The reasons announced in Clough vs. Wing, by the Supreme Court of Arizona are approved by this court in Boquillas Cattle Co. vs. Curtis, 213 U. S., 339, 347. In that case, Justice Barnes, after describing the antiquity of the irrigation works in Arizona and having shown that the riparian law which:

> "Had its origin in the Island of Great Britain, under conditions of climate peculiar to its position"

is unknown to conditions in Arizona, says:

> "Thus we see that this is the oldest method of skilled husbandry, and probably a large number of the human race have ever depended upon artificial irrigation for their food products. The riparian rights of the common law could not exist under such systems; and a higher antiquity, a better reason, and more beneficent results have flowed from the doctrine that all right in water in non-navigable streams must be subservient to its use in tilling the soil. * * * The common-law had been unknown; and that law has never been, and is not now, suited to conditions that exist here, so far as the same applies to the uses of water."
>
> Clough vs. Wing, 2 Ariz., 371, 381; 17 Pac., 453.

In Clark vs. Nash, Mr. Justice Peckham said:

> "The rights of a riparian owner in and to the use of waters flowing by his land are not the same in the arid region and mountainous States in the West that they are in States of the East. These rights have been altered by many of the Western States, by their constitutions and laws, because of the totally different circumstances in which their inhabitants are placed, from those that exist in the States of the East, and such alterations have been made for the very purpose of thereby contributing to the growth and prosperity of those States arising from mining and the cultivation of an otherwise valueless soil by means of irrigation. *This court must recognize the difference of climate and soil, which render necessary these different laws in the States so situated.*"
>
> Clark vs. Nash, 198 U. S., 361, 370.

"From these authorities we assume that the applicability of the common-law rule to the physical characteristics of the state should be considered. Its inapplicability * * * applies forcibly to the State of Nevada. Here the soil is arid, and unfit for cultivation unless irrigated by the waters of running streams. The general surface of the state is table land, traversed by parallel mountain ranges. The great plains of the state afford natural advantages for conducting water, and lands otherwise waste and valueless become productive by artificial irrigation. The condition of the country, and the necessities of the situation, impelled settlers upon the public lands to resort to the diversion and use of waters. This fact of itself is a striking illustration, and conclusive evidence of the inapplicability of the common-law rule."

Reno Smelting M. & R. Works vs. Stevenson, 20 Nev., 269, 21 Pac., 317.

"The Rio Grande, as we have said, flows through a region dependent upon irrigation. It is part of what is known as the arid region of this country. * * * Here the paramount interest is * * * the cultivation of the soil by means of irrigation. * * * The use of the waters of all these streams for irrigation is a matter of the highest necessity to the people inhabiting this region. * * * Prior to that time" (1866) "it had become established that the common law doctrine of riparian rights was unfitted to the conditions in the far West, and new rules had grown up, under local legislation and customs. * * * The doctrine of prior appropriation has been the settled law of this territory by legislation, custom and judicial decision. Indeed, it is no figure of speech to say that agriculture and mining life of the whole country depends upon the use of the waters for irrigation, and, if rights can be acquired in waters not navigable, none can have greater antiquity and equity in their favor than those which have been acquired in the Rio Grande valley in New Mexico."

United States vs. Rio Grande Dam & Irr. Co., 9 N. M., 292, 302-6.

After declaring that the maxim "first in time, first in right" should be the settled law in Idaho, the Supreme Court of that state says:

"Whether or not it is a beneficial rule, it is the lineal

descendant of the law of necessity. When, from among the most energetic and enterprising classes of the east, that enormous tide of emigration poured into the west, this was found an arid land, which could be utilized as an agricultural country, or made valuable for its gold, only by the use of its streams of water. The new inhabitants were without law, but they quickly recognized that each man should not be a law unto himself. Accustomed, as they had been, to obedience to the laws they had helped make, as the settlements increased to such numbers as justified organization, they established their local customs and rules for their government in the use of water and land. They found a new condition of things. The use of water to which they had been accustomed, and the laws concerning it, had no application here. *The demand for water they found greater than the supply, as is the unfortunate fact still all over this arid region.* Instead of attempting to divide it among all, thus making it unprofitable to any, or instead of applying the common law riparian doctrine, to which they had been accustomed, they disregarded the traditions of the past, and established as the *only rule suitable to their situation that of prior appropriation.* This did not mean that the first appropriator could take all he pleased, but what he actually needed, and could properly use without waste. Thus was established the local custom, which pervaded the entire west, and became the basis of the laws we have today on that subject."

Drake vs. Earhart, 2 Idaho, 750, 753; 23 Pac., 541.

Of the appropriation doctrine in Utah, the Supreme Court says:

"Riparian rights have never been recognized in this Territory, or in any State or Territory where irrigation is necessary; for the appropriation of water for the purpose of irrigation is entirely and unavoidably in conflict with the common law doctrine of riparian proprietorship. If that had been recognized and applied in this territory it would still be a desert; for a man owning ten acres of land on a stream of water capable of irrigating a thousand acres of land or more, near its mouth, could prevent the settlement of all the land above him. For at *common law* the riparian proprietor is entitled to have the water flow in quantity and quality past his land as it was wont to do when he acquired title thereto, and this right is *utterly irreconcilable* with the use of water for irrigation. The legislature of this Territory has

always ignored this claim of riparian proprietors, and the practice and usages of the inhabitants have never considered it applicable, and have never regarded it."

Stowell vs. Johnson, 7 Utah, 215, 225; 26 Pac., 290.

Many of the leading authorities upon this subject have been announced by the Supreme Courts of the States of Colorado and Wyoming. Some of these decisions will be quoted at length in treating of the matter of inter-watershed diversions under the doctrine of appropriation.

The Supreme Court of Colorado, in part says:

"The *common-law doctrine* giving the riparian owner a right to the flow of water in its natural channel upon and over his lands, even though he makes no beneficial use thereof, *is inapplicable to Colorado. Imperative necessity*, unknown to the countries which gave it birth, *compels the recognition of another doctrine in conflict therewith.* And we hold that, in the absence of express statutes to the contrary, the first appropriator of water from a natural stream for a beneficial purpose has, with the qualifications contained in the constitution, a prior right thereto, to the extent of such appropriation."

Coffin vs. Left Hand Ditch Co., 6 Colo., 443, 447.

"By the constitution and laws of Colorado, state and territorial, from the earliest times, rights to the beneficial use of water from natural streams have been acquired by diversion through prior appropriation rather than by grant."

Platte Water Co. vs. Southern Colorado Irr. Co., 12 Colo., 525, 531; 21 Pac., 711.

"The law of necessity rendered the common law doctrine of riparian rights wholly inapplicable in this jurisdiction, and as has frequently been stated, required its abrogation; so that * * * it has never been recognized as controlling in the matter of water rights. * * * Priority of appropriation for a beneficial purpose is the test by which this right is measured, as against others taking water from the same natural source."

Crippen vs. White, 28 Colo., 298, 302; 64 Pac., 184.

"The doctrine of this state *that the common law rule* of continuous flow of natural streams is *abolished*, is so

firmly established by our constitution, the statutes of the territory and the state, and by many decisions of this court, that we decline to reopen or reconsider it."

Sternberger vs. Seaton Co., 45 Colo., 401, 404; 102 Pac., 168.

While sitting as a judge of the Circuit Court of Appeals, Mr. Justice Van Devanter said:

"The *common-law doctrine* in respect to the rights of riparian proprietors in the waters of natural streams *never has obtained in Colorado.* From the earliest times in that jurisdiction the local customs, laws, and decisions of courts have united in rejecting that doctrine and in adopting a different one which regards the waters of all natural streams as subject to appropriation and diversion for beneficial uses and it treats priority of appropriation and continued beneficial use as giving the prior and superior right. * * * In so choosing between these inconsistent doctrines, Colorado acted within the limits of her authority, first as a territory and then as a state, and her choice was recognized and sanctioned by Congress, so far as the public lands of the United States were concerned."

Snyder vs. Colorado Gold Dredging Co., 181 Fed., 62, 65.

The Colorado doctrine of appropriation, to the exclusion and abrogation of the common-law rights, has always been recognized in Wyoming.

"The common law doctrine relating to the rights of a riparian proprietor in the water of a natural stream, and the use thereof, is unsuited to our requirements and necessities, and *never obtained* in Wyoming. So much only of the common law as may be applicable has been adopted in this jurisdiction. The doctrine invoked is inapplicable. A different principle better adapted to the material conditions of this region has been recognized. That principle, briefly stated, is that the right to the use of water for beneficial purposes depends upon a prior appropriation. Our statutes have repeatedly recognized this right, and the constitution of the State declares it. We incline strongly to the view expressed by the Supreme Court of Colorado, to the effect that such right and the obligation to protect it existed anterior to any legislation upon the subject. (Coffin v. Left Hand Ditch Co., 6 Col., 443.)

We esteem it unnecessary, if it would not indeed be superfluous, at this late day to enter into any elaborate discussion of the reasons which gave birth to this doctrine. It is the natural outgrowth of the conditions existing in this section of the country. The climate is dry; the soil is arid and largely unproductive in the absence of irrigation, but when water is applied by that means it becomes capable of successful cultivation. The benefits accruing to land upon the banks of a stream without any physical application of the water to the land are few; and while the land contiguous to water, and so favorably located as to naturally derive any sort of advantage therefrom, is comparatively small in area, the remainder, which comprises by far the greater proportion of our land otherwise susceptible of cultivation, must forever remain in their wild and unproductive condition unless they are reclaimed by irrigation. Irrigation and such reclamation can not be accomplished with any degree of success or permanency without the right to divert and appropriate water of natural streams for that purpose and a security accorded to that right. Thus, the *imperative* and growing *necessities* of our conditions in this respect alone, to say nothing of the other beneficial uses, also important, to which water has been and may be applied, has compelled the recognition rather than the adoption of the law of prior appropriation."

Moyer vs. Preston, 6 Wyo., 308, 318-19.

"Under the doctrine of prior appropriation, it would seem essential that the property in waters affected by that doctrine should reside in the public, rather than constitute an incident to the ownership of the adjacent lands. Such waters are, we think, generally regarded as public in character.

* * * In the arid region of this country another public use has been recognized by custom and laws and sanctioned by the courts. * * * This use, and the doctrine supporting it, is founded upon the *necessities* growing out of natural conditions, and is absolutely essential to the development of the material resources of the country. Any other rule would offer an effectual obstacle to the settlement and growth of this region, and render the lands incapable of continued successful cultivation. The waters for the reclamation of the desert lands must be obtained, in a very large measure, from the natural streams and other natural bodies of water.

The common law doctrine of riparian rights re-

lating to the use of the water of natural streams and other natural bodies of water not prevailing, but the opposite thereof, and one inconsistent therewith, having been affirmed and asserted by custom, laws, and decisions of courts, and the rule adopted permitting the acquisition of rights by appropriation, the waters affected thereby become perforce *publici juris.*"

Farm Inv. Co. vs. Carpenter, 9 Wyo., 110, 136; 61 Pac., 258.

In the case of Willey vs. Decker, the court reviews a great many of the leading decisions of the states of the arid west upon this subject and adopts the general rule already announced.

The court says in part as follows:

"In this State, on the other hand, the common law doctrine concerning the rights of a riparian owner in the water of a natural stream has been held to be unsuited to our conditions; and this court has declared that *the rule never obtained in this jurisdiction.*"

The court then quotes at length from that portion of the case of Moyer vs. Preston already cited, and after adopting the rule laid down in the case of Coffin vs. Left Hand Ditch Company, and the decisions of the Supreme Courts of other arid states, says:

"It will be observed that the doctrine of prior appropriation is established as a rule of imperative necessity, and the outgrowth of the custom of the earlier settlers upon the public lands for the purpose of mining or rendering the soil available for cultivation."

Willey vs. Decker, 11 Wyo., 496, 515, 519; 73 Pac., 210.

From the foregoing authorities, as well as those which we shall next consider, it would seem that the "imperative necessities" of the arid region compelled the rejection of the common-law doctrine of riparian rights and the adoption of the new appropriation doctrine, in direct conflict with the common-law rule, in each of the states of the region for regulation of the use of the waters flowing in the streams *within* the borders of each thereof.

The doctrine of appropriation has nothing in common with that of riparian rights, and their underlying principles are to be contrasted rather than compared. This is particularly true as regards geographical location of the lands which may be served,

where the common law limitations of use within the watershed have been abolished.

While an analytical discussion of each of the essential differences between the two doctrines, arranged in order of importance and under proper sub-titles, might be profitable, a general discussion of these essential differences by quotations from a number of leading authorities will sufficiently aid the court in arriving at a true interpretation of the right of the defendants to divert the waters of the Laramie River for irrigation of lands situate wholly within the foreign drainage area of the Cache la Poudre River.

(c) *Essential Differences Between Common-Law and Appropriation Doctrines, Including Right to Make Inter-watershed Diversions.*

We have previously noted that under the common-law doctrine, all owners of lands bordering and touching upon the stream have an *equal right* to the use of its waters as it flows from its source to the sea; that this right attaches as a part of the estate of the land-owner; that each of the owners of the lands bordering on the stream is entitled to make but a reasonable use of its waters, so that he will not infringe upon the like right of each of the other riparian land-owners to a similar use of the same water; that the right is not dependent upon use and is not forfeited by non-use; that no appropriator can obtain an exclusive right to the use of any portion of the waters as they flow and can only make reasonable use thereof upon his riparian lands and that he must return the water to the stream before it leaves his estate and accordingly cannot convey the water to lands in a foreign drainage from whence it cannot be returned to the stream of origin.

We have also observed that the common-law doctrine has been *entirely* rejected as unsuitable to the physical conditions and necessities of the arid region for *intra-state* diversions.

In rejecting the common-law doctrine in its entirety, each of the states of the arid region has, at the same time, rejected each of the fundamental principles upon which the doctrine is founded, including that which requires the water to be returned to the stream and prohibits its use upon lands in a foreign drainage, and we shall observe that under the doctrine of appropriation, the first appropriator may not only apply the water within a foreign drainage by reason of abrogation of the duty of return of water to supply the *equal* rights of all other riparian owners, but may also acquire the *exclusive* right to divert all of the water of the original stream if beneficial use so requires.

We will limit our discussion to the Constitution, statutes

and decisions of the courts of (1) Colorado, (2) Wyoming and (3) the decisions of the courts of other states and other authorities.

---

(1) Colorado Constitution, Statutes and Decisions.

Colorado has adopted the doctrine of appropriation and abolished the common-law rule of riparian rights in its entirety. The Constitution of the State provides:

> "The water of every natural stream, not heretofore appropriated, within the State of Colorado, is hereby declared to be the property of the public, and the same is dedicated to the *use of the people of the state,* subject to appropriation as hereinafter provided."
>
> "The right to divert the unappropriated waters of any natural stream to beneficial uses shall never be denied. Priority of appropriation shall give the better right as between those using the water for the same purpose; but when the waters of any natural stream are not sufficient for the service of all those desiring the use of the same, those using the water for domestic purposes shall have the preference over those claiming for any other purpose, and those using the water for agricultural purposes shall have preference over those using the same for manufacturing purposes."
>
> Article XVI, Sections 5 and 6, Constitution of Colorado.

Inter-watershed diversions are recognized by statute:

> "That whenever any person or company shall divert water from one public stream *and turn it into another public stream,* such person or company *may take out the same amount of water again,* less a reasonable deduction for seepage and evaporation, to be determined by the state engineer."
>
> "Any person or company *transferring water from one public stream to another* shall be required to construct and maintain under the direction of the state engineer measuring flumes or weirs and self-registering devices at the point *where the water leaves its natural watershed and is turned into another,* and also at the point where it is finally diverted for use from the public stream.
>
> Laws 1897, page 176, sections 1 and 2.
>
> Sections 3748-9 Mills' Annotated Statutes. (Rev. Ed.)
>
> Sections 3222-3, Revised Statutes Colorado, 1908.

"Whenever the owner or owners of any irrigation ditch, canal or reservoir *transferring water from one public stream to another* * * * in order that the same may be diverted therefrom for irrigation or any other purposes, shall fail and neglect to construct suitable and proper measuring flumes or weirs for the proper and accurate determination of the amount and volume of water turned into, carried through and diverted out of said public stream, then the state engineer or superintendent of irrigation shall * * * refuse to allow to be taken and diverted therefrom, any water whatever on account of delivery of water thereto, for such time and until such owner or owners shall cause to be erected or repaired such flumes or weirs at the point of delivery to and taking from said public stream so used as a conduit."

Laws 1901, page 194, section 2.
3 Mills' Annotated Statutes, Sec. 2286 b.
Revised Statutes of Colorado, 1908, Sec. 3249.

The section quoted from the law of 1901 was amended and re-enacted by the Legislature in 1911.

Laws 1911, page 464, Section 2.
Mills' Annotated Statutes (Rev. Ed.), Sec. 3773.

The Supreme Court of Colorado, at an early date, passed upon the above mentioned constitutional provisions and generally upon the abrogation of the common-law doctrine and the adoption of the appropriation doctrine. We have already quoted at some length from these decisions.

In 1882 the whole subject came before the court in a case involving the right of an appropriator to divert water for application within a drainage area foreign to the original stream. The decision by the late and learned Justice Helm is the leading authority in the United States upon the subject of inter-watershed diversions, and, as we shall later observe, is generally approved, not only by the Supreme Court of Wyoming, but as well by the state and federal courts in the arid region, and the United States. The controversy involved the diversion of water from the South Fork of St. Vrain Creek, across the divide to James Creek and thence along the bed of that stream to Left Hand Creek, which latter water-course was and since hitherto has been used as a ditch for distribution of these waters from the foreign stream by means of various smaller lateral ditches heading upon Left Hand Creek. The farmers

owning the land along Left Hand Creek thus served by waters from the St. Vrain Creek, claimed as appropriators, and the defendants proceeded to destroy the diversion dam and to take the water under claim of riparian ownership along the St. Vrain.

The opinion of the court reads in part as follows:

> "It is contended by counsel for appellants that the common law principles of riparian proprietorship prevailed in Colorado until 1876, and that the doctrine of priority of right to water by priority of appropriation thereof was first recognized and adopted in the constitution. But we think the latter doctrine has existed from the date of the earliest appropriations of water within the boundaries of the state. The climate is dry, and the soil, when moistened only by the usual rainfall, is arid and unproductive; except in a few favored sections, artificial irrigation for agriculture is an absolute necessity. Water in the various streams thus acquires a value unknown in moister climates. Instead of being a mere incident to the soil, it rises, when appropriated, to the dignity of a distinct usufructuary estate, or right of property. It has always been the policy of the national, as well as the territorial and state governments, to encourage the diversion and use of water in this country for agriculture; and vast expenditures of time and money have been made in reclaiming and fertilizing by irrigation portions of our unproductive territory. Houses have been built, and permanent improvements made; the soil has been cultivated, and thousands of acres have been rendered immensely valuable, with the understanding that appropriations of water would be protected. *Deny the doctrine of priority or superiority of right by priority of appropriation, and a great part of the value of all this property is at once destroyed.*
>
> The right to water in this country, by priority of appropriation thereof, we think it is, and has always been, the duty of the national and state governments to protect. The right itself, and the obligation to protect it, existed prior to legislation on the subject of irrigation. It is entitled to protection as well after patent to a third party of the land over which the natural stream flows, as when such land is a part of the public domain; and it is immaterial whether or not it be mentioned in the patent and expressly excluded from the grant.
>
> The act of congress protecting in patents such right

in water appropriated, when recognized by local customs and laws, 'was rather a voluntary recognition of a pre-existing right of possession, constituting a valid claim to its continued use, than the establishment of a new one.' *Broder v. Notoma* W. & M. Co., 11 Otto., 274.

We conclude, then, that the *common law doctrine* giving the riparian owner a right to the flow of water in its natural channel upon and over his lands, even though he makes no beneficial use thereof, is *inapplicable to Colorado. Imperative necessity*, unknown to the countries which gave it birth, compels the recognition of another doctrine in conflict therewith. And we hold that, in the absence of express statutes to the contrary, the first appropriator of water from a natural stream for a beneficial purpose has, with the qualifications contained in the constitution, a prior right thereto, to the extent of such appropriation. See *Schilling v. Rominger*, 4 Colo., 103." * * *

"It is urged, however, that even if the doctrine of priority or superiority of right by priority of appropriation be conceded, appellee in this case is not benefited thereby. Appellants claim that they have a better right to the water because their lands lie along the margin and in the neighborhood of the St. Vrain. *They assert that, as against them, appellee's diversion of said water to irrigate lands adjacent to Left Hand Creek, though prior in time, is unlawful.*

In the absence of legislation to the contrary, *we think that the right to water acquired by priority of appropriation thereof is not in any way dependent upon the locus of its application to the beneficial use designed.* And the disastrous consequences of our adoption of the rule contended for, forbid our giving such a construction to the statutes as will concede the same, if they will properly bear a more reasonable and equitable one.

The doctrine of priority of right by priority of appropriation for agriculture is evoked, as we have seen, by the *imperative necessity for artificial irrigation of the soil. And it would be an ungenerous and inequitable rule that would deprive one of its benefit simply because he has, by large expenditure of time and money, carried the water from one stream over an intervening watershed and cultivated land in the valley of another.* It might be utterly impossible, owing to the topography of the country, to get water upon his farm from the adjacent stream; or if possible, it might be impracticable on

account of the distance from the point where the diversion must take place and the attendant expense; or the quantity of water in such stream might be entirely insufficient to supply his wants. It sometimes happens that the most fertile soil is found along the margin or in the neighborhood of the small rivulet, and sandy and barren land beside the larger stream. To apply the rule contended for would prevent the useful and profitable cultivation of the productive soil, and sanction the waste of water upon the more sterile lands. It would have enabled a party to locate upon a stream in 1875, and destroy the value of thousands of acres, and the improvements thereon, in adjoining valleys, possessed and cultivated for the preceding decade. *Under the principle contended for, a party owning land ten miles from the stream, but in the valley thereof, might deprive a prior appropriator of the water diverted therefrom whose lands are within a thousand yards, but just beyond an intervening divide.*

We cannot believe that any legislative body within the territory or State of Colorado ever intended these consequences to flow from a statute enacted."

Coffin vs. Left Hand Ditch Co., 6 Colo., 443, 446-7, 449-50.

The doctrine announced in Coffin v. Left Hand D. Co., was affirmed by the Supreme Court of Colorado in Thomas v. Guiraud (6 Colo. 530-2), Justice Helm writing the opinion, in which the following language was used:

"We have recently held that the doctrine of priority of right to water by priority of appropriation thereof for a beneficial purpose, with the modifications declared in the constitution, is and always has been in force in this state. We have also decided that the *locus* of its application does not in any way affect the doctrine; and that a prior appropriator of water is entitled to it as against a subsequent settler upon the stream from which it is taken, although he carries it over an intervening divide and uses it to cultivate lands adjacent to another stream. *Coffin v. Left Hand Ditch Co.* (ante, p. 442.)"

The Court, in the same opinion, announces the right of the first appropriator to take all of the water in any stream, in the following language:

"Had there remained water in the stream after such diversion and use by Guiraud, plaintiff in error would

have had the undoubted right to appropriate the same. But since Guiraud diverted the usual flow of water to the full extent thereof, plaintiff in error could acquire no absolute right to any part of such usual or ordinary flow, when required by defendants in error; he might divert and use the same at such times as Guiraud and those who held under him were not in need thereof; and when there was an excess over the ordinary flow he might legally appropriate water to the extent of such excess; but when there was not enough for both, the diversion of plaintiff in error must give way to the prior right of defendants in error to the extent of Guiraud's original appropriations."

Justice Helm then announces the doctrine of appropriation of water in Colorado, in the following language:

> "*The true test of appropriation of water is the successful application thereof to the beneficial use designed; and the method of diverting or carrying the same, or making such application, is immaterial.*"
>
> *Thomas v. Guiraud*, 6 Colo., 530, 533.

The opinion in Coffin v. Left Hand Ditch Co. was thus affirmed by the Supreme Court in 1888:

> "Since the commencement of this action the questions presented have been passed upon by this court in *Coffin v. Ditch Co.*, 6 Colo. 443. In that case it was held that the common-law doctrine giving the riparian owner a right to the flow of water in its natural channel upon and over his lands, even though he makes no beneficial use of it, is inapplicable to Colorado; and that the first appropriator of water from a natural stream for a beneficial purpose has, in the absence of express statutes to the contrary, with the qualifications contained in the constitution, a prior right thereto, to the extent of such appropriation; and that this right is entitled to protection as well after patent to a third party of the land over which the natural stream flows as when such land is a part of the public domain; and it was further held that *the right to water acquired by prior appropriation is not in any way dependent upon the locus of its application to the beneficial use designed.* The questions determined in *Coffin v. Ditch Co.* are identical with the questions raised on this appeal, and such determination is in accord with the ruling on the demurrer. We do not feel called upon to enter into a discussion of these questions upon the merits."

Hammond v. Rose, 11 Colo. 524, 526; 19 Pac. 446; 7 Am. St. Rep. 258.

The facts involved in the controversy before the Court in the case of Coffin v. Left Hand Ditch Co., are set out more in detail in the opinion by Justice Elliott in Oppenlander v. Left Hand Ditch Co., rendered in 1892. The controversy involved the same diversion before the court in the former case. Justice Elliott describes the character of the diversion as follows:

> "St. Vrain creek takes its rise on the eastern slope of the Rocky Mountains near the summit of the continental divide. Thus it has a good supply of water from the regions of perpetual snow. The general course of the stream is eastward through the mountainous regions of Boulder county, and thence across the plains, until it becomes a tributary of the South Platte River.
>
> Left Hand creek is a tributary of the St. Vrain from the south; its general course is, also, eastward, until it forms a junction with the former stream some miles out upon the plains.
>
> James creek, a still smaller stream, takes its rise between the St. Vrain and Left Hand creek, and makes a junction with the latter stream before it emerges from the foothills. Neither Left Hand creek nor James creek has as good natural water supply as the St. Vrain, their sources, respectively, not being so far up the mountain slope; and as a consequence the natural water supply of Left Hand creek is not sufficient to irrigate the agricultural lands lying along its borders upon the plains.
>
> Early in the '60's certain settlers upon the plains, along the valley of Left Hand creek, made appropriations of water from said stream for the irrigation of the lands occupied by them respectively; but as there was not enough water in the natural stream to supply their wants, they undertook to increase the supply by artificial means. At a certain point in the mountains, James creek and the south fork of the St. Vrain are but a short distance apart. Taking advantage of this proximity of the two streams, a channel or ditch was cut through the narrow strip of land separating them. Thus water from the St. Vrain was carried into James creek, thence down the channel of the James to Left Hand creek, thence down Left Hand creek and out upon the plains to supply the settlers with water for irrigation.
>
> The artificial channel thus uniting the St. Vrain with James creek was first constructed in 1863, and since

that time said channel, including the natural channels of the James and the Left Hand below the junction, has been called the Left Hand ditch. This will not appear so strange when it is understood that the volume of water following in the channel of Left Hand ditch was more than doubled by the original construction of the artificial channel, and that by an enlargement thereof in 1870 the stream was increased to about ten times its original size."

Oppenlander v. Left Hand Ditch Co., 18 Colo. 142, 143-4; 31 Pac. 854.

The Court again affirms its decision in Coffin v. Left Hand D. Co., in the following language:

"*The right to divert and convey the water of a natural stream across an intervening 'divide' to be used for the irrigation of lands in the valley of another natural stream*, and for that purpose to utilize the channel of the second stream as a ditch to convey and distribute the water diverted from the first stream, *has been recognized by this court*. The diversion from the St. Vrain to the James and Left Hand creeks, as above stated, was upheld in Coffin v. Left Hand Ditch Co., 6 Colo. 449." Ib. 144.

Justice Elliott distinguishes the common law riparian rights from the Colorado law of appropriation, as follows:

"At common law the riparian owner is vested with certain rights in the water of a natural stream flowing through his land, and such rights pass by a conveyance of the land to his grantee, unless specially reserved. It is seriously claimed that this familiar principle of the common law in reference to natural streams applies also to artificial streams designed for purposes of irrigation.

Let us see what legal basis there is for such a claim. Upon examination we find few points of analogy and many points of difference between water rights at common law and water rights under the constitution of this state. For illustration, note the following:

At common law the water of a natural stream is an incident of the soil through which it flows; under the constitution the unappropriated water of every natural stream is the property of the public. At common law the riparian owner is, for certain purposes, entitled to the exclusive use of the water *as it flows through his land;* under the constitution the use of the water is

dedicated to the people of the state subject to appropriation. *The riparian owner's right* to the use of water *does not depend upon user* and is not forfeited by nonuser; *the appropriator* has no superior right or privilege in respect to the use of water on the ground that he is a riparian owner; his *right of use depends solely upon appropriation and user;* and he may forfeit such right by abandonment or by nonuser for such length of time as that abandonment may be implied. A riparian proprietor owning both sides of a running stream may divert the water therefrom, provided he returns the same to the natural stream before it leaves his own land so that it may reach the riparian proprietor below without material diminution in quantity, quality or force; *the appropriator, though he may not own the land on either bank of a running stream, may divert the water therefrom, and carry the same whithersoever necessity may require for beneficial use, without returning it or any of it to the natural stream in any manner.*

The appropriator may, under certain circumstances, change the point of diversion as well as the place of application of the water; *he has a property right in the water*, lawfully diverted to beneficial use, and *may dispose of the same separate and apart from the land* in connection with which the right ripened to anyone who will continue such use without injury to the rights of others.

Thus it appears that the constitution has, to a large extent, obliterated the common law doctrine of riparian rights and substituted in lieu thereof the doctrine of appropriation. *Sieber v. Frink*, 7 Colo. 148; *Fuller v. The Swan River Mining Co.*, 12 Colo. 12; *Strickler v. Colo. Springs*, 16 Colo. 61; *Combs v. Agricultural Ditch Co.*, 17 Colo. 146. See, also, opinions in *Farmers' High Line Co. v. Southworth*, 13 Colo. 111, and cases there cited."

Subsequent to the foregoing opinion, many inter-watershed diversions were made in Colorado which have since been used to bring large portions of its theretofore arid lands into a state of high productivity. These diversions were described by Professor Carpenter, whose testimony appears in another portion of this brief.

No further question of the legal right of the appropriator to divert the water of any Colorado stream "whithersoever necessity may require for beneficial use, without returning it or any part of it to the natural stream in any manner," seems to have been presented to the Colorado courts until the year 1908,

when it was again settled in accord with the former views of the court as above expressed. Justice Gabbert says:

> "The contention of counsel for defendants that water cannot be diverted from a stream for domestic use * * * by one not a riparian owner is not tenable. *The right to water appropriated for domestic purposes does not depend upon the locus of its use for those purposes.* Coffin v. Left Hand Ditch Co., 6 Colo., 444."
>
> Town of Sterling vs. Pawnee D. & E. Co., 42 Colo., 421, 427.

The above decisions announce the established law of Colorado, frequently confirmed in the many opinions of her courts as well as by the many statutes enacted for settling the rights of appropriators within her borders and for policing and administration of diversions from her streams. The general doctrine there announced does not seem to have been again questioned until 1908, when certain land owners sought to claim a preferred right to the use of the stream by virtue of the fact that their lands were riparian to South Clear Creek. Justice Campbell thus disposed of the contention:

> "We are entirely satisfied that the sole question argued and submitted to the trial court by counsel on both sides, was whether the common-law doctrine of continuous flow, under the facts disclosed by this record, exists in Colorado. At this late day it would seem to us, as it evidently did to the trial court, idle to make such contention in this state. The matter has long ago been set at rest. The authorities relied upon by plaintiffs are those which sustain the so-called California doctrine, first clearly and definitely announced by the supreme court of California in *Lux v. Haggin*, 69 Cal. 255, in which, *inter alia*, it was held that the common law, as to riparian ownership, was not abolished by any law of that state, but still existed there, side by side with the doctrine of appropriation. The states whose courts accept, and those whose tribunals reject, the California doctrine, and adhere to the so-called Colorado rule, are enumerated, and the various decisions collated, in Water Rights in the Western States, by Weil, at sections 16 and 17. *The Supreme Court of the United States in several cases, has approved and indicated its satisfaction with the decisions of the state courts which hold that the common-law doctrine has been abolished, and has said that each state, without interference by the federal courts, may for itself, and as between rival individual*

claimants, determine which doctrine shall be therein enforced. Atchison v. Peterson, 20 Wall. 507; Basey v. *Gallagher*, 20 Wall. 670; *U. S. v. Rio Grande*, etc., Co., 174 U. S. 690; *Clark v. Nash*, 198 U. S. 361, 370; *Kansas v. Colo.*, 206 U. S., 46-94.

* * * * * * * * * * * * * *

The doctrine in this state that the common-law rule of continuous flow of natural streams is abolished, is so firmly established by our constitution, the statutes of the territory and the state, and by many decisions of this court, that we decline to reopen or reconsider it, however interesting discussion thereof might otherwise be, and notwithstanding its importance. Perhaps the leading case in this state is *Coffin v. Left Hand Ditch Co.*, 6 Colo. 443. Others to like effect are: *Thomas v. Guiraud*, 6 Colo. 530; *Crippen v. White et al.*, 28 Colo. 298. A recent case, *Willey v. Decker*, 11 Wyo. 496, is in harmony with the Colorado doctrine, and therein Potter, Justice, in an able and exhaustive opinion, reviews the important cases from the various states and territories."

Sternberger vs. Seaton Co., 45 Colo., 401, 403-4.

The Federal Courts for the District of Colorado and the Circuit Court of Appeals have uniformly upheld the general doctrine announced in the opinion of Justice Helms in the case of Coffin vs. Left Hand Ditch Co., *supra*, and the other Colorado decisions above quoted.

To avoid unnecessary repetition, we will quote at length from the opinion in those cases decided by the United States Courts in a later portion of this brief, wherein we discuss the decision of Justice Hallett in the case of Hoge vs. Eaton, 135 Fed., 411; Snyder vs. Gold Dredging Co. (Circuit Court of Appeals), 181 Fed., 62; Cascade Town Co. vs. Empire W. & P. Co. (Circuit Court D. Colo.), 181 Fed., 1011, and Empire W. & P. Co. vs. Cascade Town Co., 205 Fed., 123.

A very interesting opinion by Judge Riner of Cheyenne, Wyoming, while sitting for the United States Circuit Court for the District of Colorado, was entered July 14, 1898, in a case involving the question whether the doctrine of riparian rights or the doctrine of appropriation prevails upon the Sangre de Cristo Mexican Land Grant, including within its boundaries the entire watershed of the Culebra River in Colorado. We fail to find the case reported in other than "I Legal Adviser," a publication of the Mills Publishing Company of Denver, and will therefore quote more at length than were the opinion to be found in the Federal Reporter:

"The demurrer presents the question whether the plaintiff can claim the right to use the water of the Culebra River as riparian proprietor, the river having its source and flowing its entire length through the land of the plaintiff. There is no allegation in the bill that the plaintiff has ever applied any of this water to a beneficial use, and no claim is made based upon its right as a prior appropriator. Its claim is made upon the sole ground that the stream has its source and flows its entire length through the lands of the plaintiff, and that the grant, the treaty and the act of congress secure to it the rights of a riparian owner.

Without discussing the question at length, I am inclined to the view that the riparian rights of such a riparian proprietor do not differ in any respect from those held by any other riparian proprietor who derives his title immediately, or mediately, from the United States, and that the *power to prescribe the rules which define and regulate the water rights of private riparian proprietors upon unnavigable streams belongs exclusively to the legislature of the state.*

Colorado was admitted into the Union upon an equal footing with the original states. Whatever the limitation upon her powers as a government may have been, while in a territorial condition, it ceased to have any operative force, except as voluntarily adopted by her after she became a state of the Union. On her admission she at once became entitled to and possessed of all the rights of dominion and sovereignty which belonged to the original states.

The stipulations of the treaty with Mexico referred to, operated upon and protected the titles of those private proprietors who held tracts of land within the territory ceded to the United States under grants from the Mexican government. These stipulations simply provide that the actual and bona fide grantees from the Mexican government shall continue to be the owners of their respective lands, although the territory has passed into the domain of the United States, and that their right of ownership shall be respected by this government. The legislation of congress operated solely upon the titles by declaring, establishing and confirming the private ownership of the grantees as derived from the Mexican government.

The treaty with Mexico, while it secured to private owners the title and ownership of the tracts of land

which had been granted them by Mexico, did not attempt to provide that this ownership should be governed by rules of law different from those which govern and control all private ownership of lands within the territorial jurisdiction of the United States or of any particular state. And the source of the plaintiff's title can, I think, make no difference as to the rights of property which accompany and flow from its ownership.

The constitution of the State of Colorado provides that the water of every natural stream not heretofore appropriated within the State of Colorado, is hereby declared to be the property of the public and the same is dedicated to the use of the people of the state subject to appropriation as hereinafter provided. It further provides that the right to divert unappropriated waters of any natural stream for beneficial uses shall never be denied, and that priority of appropriation shall give the better right as between those using the water for the same purpose (Art. 16, §§ 5-6).

It was early held in Colorado that the common-law doctrine as to the riparian rights by which the riparian proprietor is entitled to the flow of water in its natural channel upon and over his lands, whether he makes any beneficial use of it or not, is inapplicable to Colorado. (Coffin vs. Left Hand Ditch Company, 6 Colo., 447). *This doctrine is sustained in most, if not all, of the states (except California) within what is known as the arid region.*

The common-law doctrine relating to the rights of a riparian proprietor in the water of a natural stream, and the use thereof, is unsuited to our requirements and necessities and never did obtain in this region of country. A different principle, viz., that the right to use water for beneficial purposes depends upon a prior appropriation, is much better adapted to the material conditions existing in this and adjoining states.

The Supreme Court of Wyoming in the case of Moyer vs. Preston (44 Pac. Rep., 847), after speaking approvingly for the doctrine announced in the case of Coffin vs. The Ditch Company, says:

'We esteem it unnecessary, if indeed it would not be superfluous, at this late day, to enter into any elaborate discussion of the reasons which gave birth to this doctrine. It is the natural outgrowth of the conditions existing in this section of the country. The climate is dry. The soil is arid, and largely unproductive in the

absence of irrigation, but, when water is applied by that means it becomes capable of successful cultivation. The benefits accruing to land upon the banks of a stream without any physical application of the water to the land are few; and while the land contiguous to water, and so favorably located as to naturally derive any sort of advantage therefrom, is comparatively small in area, the remainder, which comprises by far the greater proportion of our lands otherwise susceptible of cultivation, must forever remain in their wild and unproductive condition, unless they are reclaimed by irrigation. Irrigation and such reclamation cannot be accomplished with any degree of success or permanency without the right to divert and appropriate water of natural streams for that purpose, and a security accorded to that right. Thus the imperative and growing necessities of our conditions in this respect alone, to say nothing of the other beneficial uses, also important, to which water has been and may be applied, have compelled the recognition, rather than the adoption, of the law of prior appropriation.'

The Supreme Court of the United States in the case of Broder vs. The Water Company (101 U. S., 274, 276 [1879]), said:

'It is the established doctrine of the court that rights of miners, who had taken possession of mines, and worked and developed them, and the rights of persons who had constructed canals and ditches to be used in mining operations and for purposes of agricultural irrigation in the region where such artificial use of the water was an absolute necessity, are rights which the government had by its conduct recognized and encouraged and was bound to protect before the passage of the act of 1866. We are of the opinion that the section of the act which we have quoted was rather a voluntary recognition of a pre-existing right of possession constituting a valid claim to its continued use than the establishment of a new one.'

The Supreme Court of this State, in the case of Coffin vs. The Ditch Company, *supra*, held to the doctrine that it has always been the duty of the state and national governments to protect the right of water in this country by priority of appropriation, and proceeds to say that the right itself and the obligation to protect it existed prior to legislation on the subject of irrigation. *That the state has the power to regulate the use of water*

within its boundaries I have no doubt. And to the legislature of the state the authority is most properly confided, to authorize the use of water and to impose such regulations and limitations upon its use as will best reconcile and accommodate the interests of all concerned.

Ample provision is made by the laws of the State of Colorado for the determination and protection of the rights of its citizens who use the waters of the state by providing a tribunal wherein the rights of all parties interested may be determined according to the priority of their application thereof to a beneficial use. The irrigation of arid lands is a public purpose, and the water thus used is put to a public use; and a statute providing for such irrigation is a valid exercise of legislative power. Under the proceedings provided by the legislature of Colorado, due process of law is furnished and equal protection of the law given. These statutes provide for a hearing, upon notice to the parties interested, before a tribunal created for the purpose of determining whether the parties have complied with the statutory provisions by appropriating the water, that is to say, by applying it to a beneficial use. In all respects these statutes furnish due process of law. (14th Amend., § 1.)

There being no allegation in the case that the plaintiff has made an appropriation of the water of this stream, or any portion of it, by applying it to a beneficial use, and that such appropriation was prior in time to the appropriation of the defendants, it is not entitled to the relief prayed for.

As this disposes of the case it is unnecessary to discuss other questions suggested in the argument. The demurrer will be sustained and the bill dismissed."

United States Freehold Land & Emigration Co. vs. Gallegos et al. (No 2545 U. S. Cir. Ct. D. of Colo.); 1 Legal Adviser, 412, 415-18.

The above case was reversed by the Circuit Court of Appeals (U. S. Freehold L. & E. Co. vs. Gallegos, 89 Fed., 769, 771) on a technical ground, but in the opinion the court refrains from passing upon the questions decided by Judge Riner in the following language:

"The question is of serious import and the effects of its decision must be grave and far-reaching. * * * Accordingly, we deem it our duty to refrain from consid-

ering or expressing our opinion upon it, and nothing that is said in this opinion is intended to express or intimate our views concerning it."

The correctness of Judge Riner's conclusions, upon which the Circuit Court of Appeals refused to pass, is supported by ample authority.

Boquillas Cattle Co. vs. Curtis, 213 U. S., 339, 342.
Kansas vs. Colorado, 206 U. S., 46.
Gutierres vs. Albuquerque Land & Cattle Co., 188 U. S., 545, 550.
United States vs. Rio Grande Irr. Co., 174 U. S., 690.
Kinney on Irrigation (2 Ed.), Sec. 583, pages 998-1003 and cases cited.

While further citation of authorities might be profitable and interesting, the foregoing sufficiently announce the doctrine of appropriation as it obtains in Colorado including the right of the appropriator to *convey* the water from any stream and use it "whithersoever necessity may require" including lands upon foreign watersheds "without returning it or any of it to the natural stream."

---

(2) Wyoming Constitution, Statutes and Decisions.

Wyoming has adopted the Colorado doctrine of appropriation in its entirety, save for some more recent changes of procedure for initiation and adjudication of the various water rights. This is admitted by counsel for plaintiff (Brief, pages 85-7).

The Constitution of Wyoming, Article VIII, Sections 1 and 3, provides:

"Section 1. The water of all natural streams, lakes or other collections of still water, within the boundaries of the state, are hereby declared to be the property of the state."

"Section 3. *Priority of appropriation for beneficial uses shall give the better right.* No appropriation shall be denied except when such denial is demanded by the public interests."

The statutes of Wyoming more explicitly declare the doctrine of appropriation and provide a code of procedure for carrying it into effect. We will refer only to certain sections of

immediate interest, which were read into the record, pages 3910-18, but were not extended in the abstract. They are in part as follows:

> "A water right is a right to use the water of the state, when such use has been acquired by the beneficial application of water under the laws of the state relating thereto, and in conformity with the rules and regulations dependent thereon. *Beneficial use shall be the basis, the measure and limit of the right to use water at all times*, not exceeding in any case, the statutory limit of volume. Water being always the property of the state, rights to its use shall attach to the land for irrigation, or to such other purpose or object for which acquired in accordance with the beneficial use made and for which the right receives public recognition, under the law and the administration provided thereby. Water rights cannot be detached from the lands, place or purpose for which they are acquired, without loss of priority."
>
> Laws 1909, Chapter 68, Section 1.
> Wyoming Compiled Statutes, 1910, Sec. 724, p. 247.

The above section was evidently enacted subsequent to the decision in the case of Johnson vs. Irrigation Co., 13 Wyo., 208, which we shall hereinafter consider.

> "Any person, association or corporation hereafter intending to acquire the right to the beneficial use of the public water of the state of Wyoming shall, before commencing the construction, enlargement or extension of any ditch, canal or other distributing works, or performing any work in connection with said construction, or proposed appropriation, make an application to the state engineer for a permit to make such appropriation. * * *"
>
> Laws Wyoming, 1895, Ch. 45, Sec. 1.
> Wyoming Compiled Statutes, 1910, Section 727.

> "All applications which shall comply with the provisions of this chapter, and with the regulations of the engineer's office, shall be recorded in a suitable book kept for that purpose; *and it shall be the duty of the state engineer to approve all applications* made in proper form, which contemplate the application of the water to a *beneficial use* and *where the proposed use does not tend to impair the value of existing rights, or be otherwise detrimental to the public welfare.* But where there is no unappropriated water in the proposed source of supply, or where the proposed use conflicts *with existing*

rights, or threatens to prove detrimental to the public interest, it shall be the duty of the state engineer to reject such application and refuse to issue the permit asked for."

Laws 1895, Chapter 45, Sec. 1.
Wyoming Compiled Statutes (1910), Sec. 729.

"The refusal or approval of an application shall be endorsed thereon and a record made of such endorsement in the state engineer's office. The application so endorsed shall be returned to the applicant. If approved, the applicant shall be authorized on receipt thereof, to proceed with the construction of the necessary works, and to take all steps required to apply the water to a beneficial use, and to perfect the proposed appropriation. If the application is refused, the applicant shall take no steps toward the prosecution of the proposed work, or the diversion and use of the public water so long as such refusal shall continue in force."

Wyoming Compiled Statutes 1910, Sec. 730.

"Upon it being made to appear to the satisfaction of the Board of Control, that any appropriation has been perfected in accordance with such application, and the endorsement thereof of the state engineer, it shall be the duty of the Board of Control * * * to send to the county clerk a certificate of the same character as that described in Section 778, which certificate shall be recorded in the office of the county clerk as recorded in said section."

Revised Statutes Wyoming, 1899, Sec. 928.
Wyoming Compiled Statutes, 1910, Sec. 738.

"The priority of such appropriation shall date from the filing of such application in the state engineer's office."

Revised Statutes 1899, Sec. 929.
Wyoming Compiled Statutes, 1910, Sec. 739.

"*Rights to the use of water shall be limited and restricted to so much thereof as may be necessarily used for irrigation or other beneficial purposes as aforesaid;* irrespective of the carrying capacity of the ditch, and *all the balance of the water* not so appropriated shall be allowed to run in the natural stream from which such ditch draws its supply of water, and shall not be considered as having been appropriated thereby; and in case the owner or owners of any such ditch, canal or reservoir shall fail to use the water therefrom for irrigation

or other beneficial purposes during any five successive years, they shall be considered as having abandoned the same, and shall forfeit all water rights, easements and privileges, appurtenant thereto, and water formerly appropriated by them may be again appropriated for irrigation and other beneficial purposes, the same as if such ditch, canal or reservoir had never been constructed; neither shall the owner or owners of such ditch, canal or reservoir have any right to receive from others any royalty for the use of water carried thereby, but every such owner or owners having a surplus of water and furnishing the same to others from any ditch, canal or reservoir as herein provided, shall be considered common carriers and shall be subjected to the same laws that govern common carriers."

Revised Statutes 1899, Sec. 895.
Wyoming Compiled Statutes, 1910, Sec. 741.

"The final orders or decrees of the State Board of Control, in proceedings provided by law for the adjudication and determination of rights to the use of public waters of the state, *shall be conclusive* as to all prior appropriations, and the rights of all existing claimants upon the stream or other body of water lawfully embraced in the adjudication, subject, however, to the provisions of law for re-hearings in such proceedings and for the re-opening of the orders and decrees therein and for appeals from such orders or decrees."

Laws 1901, Chapter 67, Sec. 1.
Wyoming Compiled Statutes, 1910, Sec. 793.

The comparatively few decisions which have been announced by the Supreme Court of Wyoming, are, nevertheless, voluminous and exhaustive. The principles of these decisions uphold and adopt the strict doctrine of appropriation as announced in Colorado.

Moyer vs. Preston, 6 Wyo., 308.
Farm Investment Co. vs. Carpenter, 9 Wyo., 110; 61 Pac., 258.
Willey vs. Decker, 11 Wyo., 498; 73 Pac., 210.
Johnston vs. Irrigation Co., 13 Wyo., 228; 79 Pac. 22.

We have already quoted at length from Moyer vs. Preston (6 Wyo., 308), also from Farm Investment Co. vs. Carpenter (9 Wyo., 110).

The following excerpts from the opinions may be of additional value:

In discussing Section 1, Article VIII of the Constitution, which declared that the "waters of all natural streams * * * within the boundaries of the State are hereby declared to be the property of the State," Chief Justice Potter construes the language as synonymous with the declaration of the Colorado Constitution declaring that the unappropriated waters of the stream are the property of the public. He says:

> "The effect of such a declaration has been determined by the courts of Colorado, whose constitution declares that the unappropriated waters of the streams within the State are the property of the public. In the case of Wheeler v. Northern Colo. I. Co., 10 Colo., 582, Mr. Justice Helm, in delivering the opinion of the court, said, 'Our constitution dedicates all unappropriated water in the natural streams of the State to the use of the people, the ownership thereof being vested in the public. We shall presently see that after appropriation, the title to this water, save perhaps as to the limited quantity that may be actually flowing in the consumer's ditch or lateral, remains in the general public, while the paramount right to its use, unless forfeited, continues in the appropriator.'
>
> Again, in Fort Morgan L. & C. Co. v. So. Platte Ditch Co., 18 Colo., 1, in the opinion delivered by Mr. Chief Justice Hayt, it is said, 'Under our constitution, the water of every natural stream in this State is deemed to be the property of the public. Private ownership of water in the natural streams is not recognized. The right to divert water therefrom and apply the same to beneficial uses is, however, expressly guaranteed. By such diversion and use a priority of right to the use of water may be acquired.'
>
> There is to be observed no appreciable distinction, *under the doctrine of prior appropriation, between a declaration that the water is the property of the public, and that it is the property of the State.*
>
> It is said in McCready v. Virginia, 94 U. S., 391, in discussing the subject of tide waters: 'In like manner the States own the tide waters themselves. * * * For this purpose, the State represents its people, and the ownership is that of the people in their united sovereignty.' See also Martin v. Waddell, 16 Pet., 410; Gould on Waters, Sec. 32; Kinney on Irrigation, Secs. 51, 53; Bell v. Gough, 23 N. J. L., 624. 'The Sovereign is trustee for the public.' 3 Kent's Com., 427; Miller v. Mendenhall (Minn.), 8 L. R. A., 89.
>
> The ownership of the State is for the benefit of the public or the people. By either phrase, 'property of the

public' or 'property of the State,' *the State, as representative of the public or the people, is vested with jurisdiction and control in its sovereign capacity.*"

The court then continues with a lengthy discussion of the right of the state to administer the distribution of the waters within its borders by adjudication and fixing of priorities by the Board of Control and by subsequent enforcement of their "certificates" or decrees by the water officials.

Farm Investment Co. vs. Carpenter, 9 Wyo., 110, 138-9.

While considering the case of Coffin vs. Left Hand D. Co., supra, Justice Potter said:

"It was held that it did not prevent the diversion of the water of one stream to irrigate lands lying adjacent to or in the locality of another. * * * We are perfectly content, however, therewith. It is in accord with our own views."

Moyer vs. Preston, 6 Wyo., 308, 321.

In Willey vs. Decker, Justice Potter makes an exhaustive review of the leading authorities of the arid west relating to the appropriation of water, including those of Colorado, and adopts the arid region or Colorado doctrine as the law of Wyoming. While quotation of the entire opinion would be very profitable, we shall, nevertheless, content ourselves with a few excerpts therefrom. After an exhaustive and favorable review of the decisions of the leading authorities in the arid west, including the case of Coffin vs. Left Hand Ditch Co., 6 Colo., 443, as well as of the decisions of the courts in the states of Montana and Nebraska where the common law doctrine in large measure prevails, he says:

"From our somewhat extended review of the origin of *the doctrine of prior appropriation* of the waters of natural streams, *it is quite clear that neither the custom or necessity that gave birth to the doctrine was confined to riparian lands.* With respect to irrigation, the *same necessity* existed in the case of *all* lands, whether bordering on a stream or otherwise. Indeed, if there was any difference, the *necessity was greater in the case of non-riparian lands.* They constituted, and continue to constitute, the far greater body of lands whose cultivation is desirable, and upon the productiveness of which the welfare of the country in a large measure depends. And *it is an undoubted fact* that from an early date, if not from the very beginning, the custom of the *settlers* in

the diversion of running water for purposes of irrigation *disregarded the location of the lands*, except in so far as irrigation was at first confined to lands upon which water could be the more easily and inexpensively conducted.

It is hardly necessary, therefore, to cite authority upon the proposition that, *under the doctrine of prior appropriation, it is not now and never has been essential to a water right, that the appropriator should apply the water upon land commonly or legally known as riparian.*"

* * * * * * * * * * *

"The act of Congress of 1866 granting rights of way for ditches over the public lands recognized a custom to conduct water to lands other than those situated on the margin of streams. Mr. Kinney asserts that a *valid appropriation may be made for the irrigation of lands*, or for any other beneficial use, *not situated upon or near the stream.* (Kinney on Irr., 156.) *And we think this proposition is conceded in every jurisdiction where the doctrine is to any extent enforced.*

In the Colorado case of Coffin v. Left Hand Ditch Co., *supra*, the appellee claimed to have appropriated certain water from St. Vrain Creek, through its diversion by means of a ditch which conducted the water to the James Creek, thence along the bed of the same to Left Hand Creek, where it was again diverted by lateral ditches, and used to irrigate lands adjacent to the last named stream. It was contended that such appropriation was unlawful. But the court upheld it, and said: 'In the absence of legislation to the contrary, we think that the right of water acquired by priority of appropriation thereof is not in any way dependent upon the *locus* of its application to the beneficial use designed. And the disastrous consequences of an adoption of the rule contended for forbid our giving such a construction to the statutes as will concede the same, if they will properly bear a more reasonable and equitable one. The doctrine of priority of right by priority of appropriation for agriculture is evoked; as we have seen, by the imperative necessity for artificial irrigation of the soil. And it would be an ungenerous and inequitable rule that would deprive one of its benefit simply because he has, by large expenditure of time and money carried the water from one stream over an intervening watershed and cultivated land in the valley of another. It might be utterly impossible, owing to the topography of the country, to get water upon his farm from the adjacent stream; or, if possible, it might be impracticable on account of the distance from the point where the diver-

sion must take place and the attendant expense; or the quantity of water in such stream might be entirely insufficient to support his wants.'

The Supreme Court of the State of Washington say that, 'The right of appropriation, as defined by the best authorities, is not controlled by the location of the stream with reference to the premises which are irrigated.' (Offield vs. Ish, 21 Wash., 277; 57 Pac., 809. See also Long on Irr., 50; Thomas v. Guiraud, 6 Colo., 530; Hammond v. Rose, 11 Colo., 524; 19 Pac., 466; Oppenlander v. Left Hand Ditch Co., 18 Colo., 142; 31 Pac., 854.) The court say in the case last cited: 'The appropriator, though he may not own the land on either bank of a running stream, may divert the water therefrom, and carry the same whithersoever necessity may require for beneficial use, without returning it, or any of it, to the natural stream, in any manner.'"

Willey vs. Decker, 11 Wyo., 496, 529-31.

While the conclusions of the court to the effect that the Wyoming Courts have the right to decree and settle rights to the use of water in Montana is not in accord with the better authority as announced in Kansas vs. Colorado, *supra;* Lamson vs. Vailes, 27 Colo., 201; Stockman vs. Leddy, 55 Colo., 24; Turley vs. Furman, 16 N. M., 253; and particularly to the doctrines announced by the same learned justice in Grover Irr. Co. vs. Lovella Ditch Co., 21 Wyo., 204, the court nevertheless adopts, without question, the general law of appropriation, including the right to divert water from one stream for application and use upon lands in no sense riparian and situate at a remote distance from the stream and from which no return of water can be expected as required by the common law doctrine.

The principles announced in the above case of Willey vs. Decker seem to have been adopted without further question, and we find no subsequent reported cases dealing with this phase of the appropriation doctrine. It is interesting, however, to note that these appropriations have been universally recognized, approved and decreed by the Board of Control, possessing full power to hear, determine, grant and adjudicate all water rights in that state.

The judicial determinations of the Board of Control are as conclusive in their nature as are those of the District Courts in Colorado, and are to be taken as equivalent to the financial and conclusive decree of a judicial tribunal, save for rights of appeal provided by statute.

Constitution of Wyoming, Art. VIII, Sec. 2.

Wyoming Compiled Statutes, 1910, Secs. 778 and 793.
Farm Inv. Co. vs. Carpenter, 9 Wyo., 110; 61 Pac., 258.
Parshall vs. Cowper, 22 Wyo., 385.

Section 2 of Article VIII of the Constitution provides:

> "There shall be constituted a Board of Control, to be composed of the state engineer and superintendents of water divisions; which shall, under such regulations as may be prescribed by law, have supervision of the waters of the state and of their appropriation, distribution and diversion and of the various officers connected therewith. Its decisions to be subject to review by the courts of the state."

Section 778 of the Wyoming Compiled Statutes, 1910, provides in part as follows:

> "As soon as practical after the determination of the priorities of appropriation of the use of waters in any stream, it shall be the duty of the secretary to issue to each person, association or corporation, represented in such determination, a certificate to be signed by the state engineer as president of the Board of Control, and attested under seal by the secretary of said board, setting forth the name and postoffice address of the appropriator; *the priority date and number of each such appropriation; the amount of water appropriated.* * * *"

Section 793, *supra*, provides that the final orders and decrees of the State Board of Control shall be conclusive as to all prior appropriations and the rights of all existing claimants upon the stream.

In the case of Farm Investment Co. vs. Carpenter, *supra*, the Supreme Court defined the powers of the Board of Control as quasi-judicial in their nature. The same court, in a decision announced in April, 1914, says:

> "In determining the rights and priorities of the several claimants the Board of Control was required to ascertain and determine the carrying capacity of ditches and the amount of land then irrigated or susceptible of irrigation by means of each ditch and the amount of water appropriated to each ditch or canal. * * * Neither the State Engineer nor his subordinates had the right to change, modify or annul that *adjudication* or to prevent plaintiff from the use of that amount of water,

except to prevent waste. The duty of the officers authorized and required to distribute the waters of a stream is to divide the water according to the rights of the appropriators as determined by the Board of Control. That is their authority for the distribution, and without it they cannot lawfully make such distribution. * * *

The adjudication by the Board of Control as to the quantity of water to which an appropriator is entitled is as *conclusive upon the water distributors as its determination of priorities*, with the exception that he may regulate a headgate so as to prevent waste. For the purpose of governing those officers in the discharge of their duties in dividing waters between appropriators, *the adjudication of the Board of Control is as conclusive as though an appeal had been taken from its decision and a decree entered by the court.*"

Parshall vs. Cowper, 22 Wyo., 385, 393-4.

The granting of permits by the state engineer has the same quasi-judicial effect. By Section 727, Wyoming Compiled Statutes, 1910, above quoted, all parties intending to commence the construction of any diversion system must first make application for permit so to do. By Section 729, it is the duty of the State Engineer to approve these applications, if in due form, unless he shall, in his quasi-judicial capacity, find that there is no unappropriated water in the proposed source of supply or that the proposed use conflicts with existing rights or threatens to prove detrimental to public interest, in either of which latter instances it is his duty to refuse to grant the permit, whereupon, the appropriator is precluded from commencing the construction of his enterprise. If the permit is granted and the works are completed, the appropriator has the right to make diversion in accordance with the terms and conditions of the permit, and by Section 738 of the statutes, a proper showing to the satisfaction of the Board of Control that the appropriation has been perfected in accordance with the application, a certificate of final decree of the same character as that described in Section 778 shall be awarded the appropriator.

The State Engineer's permit and its judicial effect were ably construed by Chief Justice Potter in the case of Whalon vs. North Platte Canal etc. Co. A clear understanding of the legal effect of this decision can best be obtained by reading the opinion. He said in part:

"Under our present statutory system, the inceptive point or date of a water right is not the commencement of construction, or even the commencement of survey. It is the filing of the application for a permit. Survey

must, of course, be made, and it generally, no doubt, antedates the application. There must be construction, and if there has been none an abandonment may be the result. Formerly any person could, without permission of any one, inaugurate and complete an appropriation of water. And many appropriations now existing, made before the adoption of the present statutes, have been established, and others will be established, in respect to priorities, upon evidence as to time of commencing work or making surveys.

Since the enactment into our laws of the system now in force, a water right is not inaugurated by constructing a ditch. The law provides that before beginning construction an application for permit shall be filed; and upon its approval the applicant is authorized to proceed with construction. * * * A ditch that is built without authority, the building of which confers no right upon the owner to divert water, is not such a ditch as the statute mentions."

And further on in the same opinion, the court says:

"The water to be appropriated by defendant under the permit to their grantors has been duly conveyed to the defendant. The title to the water right has duly passed to it from the original applicants or appropriators.

Plaintiff can acquire an interest only in the use of unappropriated waters. The water remains public, but the right to its use appropriated under the permit to defendant's grantors, until the same may be abandoned or forfeited, is no longer in the State to grant."

Whalon vs. North Platte Canal etc. Co., 11 Wyo., 313, 344, 351; 71 Pac., 995.

The record shows, without contradiction, that a considerable portion of the most valuable agricultural lands in Wyoming are now and for long years have been irrigated with waters obtained by means of inter-watershed diversions, and that these diversions have been approved, adjudicated and decreed by the Board of Control and District Courts of the State of Wyoming. This particularly applies to the Sheridan and Wheatland districts.

It also shows that the State Engineer has granted permits authorizing the construction of many new systems for the purpose of diverting water from one stream for application upon lands in a foreign drainage area, even to the extent of authorizing a small inter-watershed diversion from Cache la Poudre waters for irrigation of lands lying in the foreign drainage of the Laramie River.

These inter-watershed diversions have already been described in detail in a former portion of this brief and repetition is here unnecessary (see subdivision "Wyoming" under general title "Inter-watershed Diversions").

There are doubtless other reported cases in the same degree bearing upon the general doctrine of appropriation and inter-watershed diversions, as adopted, considered and applied in Wyoming, but we believe the foregoing are conclusive of the fact that the Colorado system and the arid region doctrine of appropriation, in all its fundamental principles, prevails in Wyoming; that the doctrine of riparian rights is there entirely abrogated and the new doctrine of appropriation adopted as better suited to the new conditions and necessities of the country, and that in abrogating the common-law doctrine, the inhibition against inter-watershed diversions on account of use of water on non-riparian lands from which such water cannot be returned to the stream of origin, has been likewise abolished and the rule announced in Colorado, that the appropriator may divert the water from any stream "and carry the same whithersoever necessity may require, for beneficial use, without returning it or any of it to the natural stream" obtains with like effect in Wyoming.

---

(3) Other Decisions and Authorities.

The United States has approved and ratified the arid region doctrine of appropriation, as distinguished from the common-law doctrine of riparian rights, by the following Acts of Congress:

> "Whenever, by priority of possession, rights to the use of water for mining, agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and decisions of Courts, the possessors and owners of such vested rights shall be maintained and protected in the same; and the right of way for the construction of ditches and canals for the purposes herein specified is acknowledged and confirmed; but whenever any person, in the construction of any ditch or canal, injures or damages the possession of any settler on the public domain, the party committing such injury shall be liable to the party injured for such injury or damage."
>
> Act of Congress, July 26, 1866.
> 7 Fed. Stats. Ann., 1905, p. 1090.
> Rev. Stats. of U. S., 1878, sec. 2339.
> 14 Stat. L., 523.

"All patents granted, or pre-emptions or homesteads allowed, shall be subject to any vested and accrued water rights, or rights to ditches and reservoirs used in connection with such water rights, as may have been acquired under or recognized by the preceding section."

Act of Congress of July 9, 1870.
7 Fed. Stat. Ann., 1905, p. 1096.
U. S. Rev. Stats., 1878, sec. 2340.
16 Stat. L., 218.

"*Provided, however*, That the right to the use of water by the persons so conducting the same on or to any tract of desert land of six hundred and forty acres shall depend upon *bona fide* prior appropriation; and such right shall not exceed the amount of water actually appropriated and necessarily used for the purpose of irrigation and reclamation; and all surplus water over and above such actual appropriation and use, together with the water of all lakes, rivers and other sources of water supply upon the public lands and not navigable, shall remain and be held free for the appropriation and use of the public for irrigation, mining and manufacturing purposes subject to existing rights."

Act of Congress, March 3rd, 1877.
19 Stat. L., 377.

"That the right of way through the public lands and reservations of the United States is hereby granted to any canal or ditch company formed for the purpose of irrigation and duly organized under the laws of any State or Territory which shall have filed, or may hereafter file, with the Secretary of the Interior a copy of its articles of incorporation, and due proofs of its organization under the same, to the extent of the ground occupied by the water of the reservoir and of the canal and its laterals, and fifty feet on each side of the marginal limits thereof; also the right to take, from the public lands adjacent to the line of the canal or ditch, material, earth and stone necessary for the construction of such canal or ditch: *Provided*, That no such right of way shall be so located as to interfere with the proper occupation by the Government of any such reservation, and all maps of location shall be subject to the approval of the department of the Government having jurisdiction of such reservation, and the privilege herein granted shall not be construed to interfere with the control of water for irrigation and other purposes under authority of the respective States or Territories."

Act of Congress of March 3, 1891.
26 Stat. L., 1096, 1097.

"That nothing in this act shall be construed as affecting or intending to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this act, shall proceed in conformity with such laws, and nothing herein shall in any way affect any right of any State or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof; *Provided*, That the right to the use of water acquired under the provisions of this act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right."

National Reclamation Act, July 17, 1902.
7 Fed. Stat. Ann., 1905, p. 1098.
32 Stat. L., 388.

These acts have been repeatedly construed by this court, and particular reference is made to them in the following cases:

Atchison vs. Peterson, 20 Wall., 507.
Jennison vs. Kirk, 98 U. S., 453, 456.
Broder vs. Natoma Water Co., 101 U. S., 274; 25 L. Ed., 790.
United States vs. Rio Grande Irr. Co., 174 U. S., 690, 705-6.
Gutierres vs. Albuquerque Land & Irr. Co., 188 U. S., 545, 552-5.
Clark vs. Nash, 198 U. S., 361, 370.
Kansas vs. Colorado, 206 U. S., 46, 94; 51 L. Ed., 956.
Boquillas Land & Cattle Co. vs. Curtis, 213 U. S., 339, 344-5; 53 L. Ed., 822.

The construction placed upon them by this court has been universally adopted throughout the arid region, including Colorado and Wyoming.

Union Mill & Mining Co. vs. Dangberg, 81 Fed., 73, 95.
Snyder vs. Colorado Gold Dredging Co., 181 Fed., 62, 65; 104 C. C. A., 136.
Cascade Town Co. vs. Empire Water & Power Co., 181 Fed., 1011, 1014-15.

Empire Water & Power Co. vs. Cascade Town Co., 205 Fed., 123, 127.
Coffin v. Left Hand Ditch Co., 6 Colo., 443, 447, 449.
Willey vs. Decker, 11 Wyo., 496, 519-22; 73 Pac., 210.

In construing the above statutes, this court and the federal and state courts of the arid west have universally held that Congress has recognized and approved the adoption of the doctrine of appropriation and the rejection of the common law riparian doctrine by each of the states of the arid west in the exercise of its sovereign control of the waters of the streams *within* its borders.

Kinney on Irrigation (2 Ed.), V. 1, Chap. 32, pages 1027-97.

In Jennison vs. Kirk, Mr. Justice Field said:

"The first appropriator of water to be conveyed to such localities for mining or other beneficial uses, was recognized as having, to the extent of actual use, the better right.

The doctrines of the common law respecting the rights of riparian owners were not considered as applicable, or only in a very limited degree, to the conditions of the miners in the mountains. The waters of rivers and lakes were consequently carried *great distances* in ditches and flumes, constructed with vast labor and enormous expenditures of money, along the sides of mountains and through canons and ravines, to supply communities engaged in mining as well as for agriculturalists and ordinary consumption."

Jennison vs. Kirk, 98 U. S. (Otto.), 453, 458.

In Broder vs. Natoma Water Co., Mr. Justice Miller said:

"It is the established doctrine of the court that the rights of the miners, who had taken possession of mines and worked and developed them, and the rights of persons who had constructed canals and ditches to be used in mining operations *and for purposes of agricultural irrigation*, in the region where such artificial use of the water was an *absolute necessity*, are rights which the Government had by its conduct recognized and encouraged and was bound to protect before the passage of the Act of 1866. We are of opinion that the section of the act which we have quoted was rather a voluntary *recognition of a pre-existing right of possession*, constituting a valid

claim to its continued use than the establishment of a new one. This subject has so recently received our attention and the grounds on which this construction rests are so well set forth in the following cases, that they will be relied on without further argument: Atchison v. Peterson, 20 Wall., 507; Basey v. Gallagher, Id., 670; Forbes vs. Gracey, 94 U. S., 762; Jennison v. Kirk, 98 U. S., 453."

Broder vs. Natoma Water Co., 101 U. S., 274, 276.

In the case of United States vs. Rio Grande Irr. Co., Mr. Justice Brewer, after affirming the construction of the act of 1866 in Broder vs. Water Co., supra, thus construes the acts of 1877 and 1891:

"Obviously, by these acts, so far as they extended, Congress recognized and assented to the appropriation of water in *contravention* of the common-law rule as to continuous flow. * * * And in reference to all those cases of purely local interest, the obvious purpose of Congress was to give its assent, so far as the public lands were concerned, to any system, *although in contravention to the common-law rule*, which permitted the appropriation of those waters for legitimate industries."

After having quoted the definition of common-law riparian rights as given by Chancellor Kent (3 Kent Com., Sec. 439) he said:

"While this is undoubted, and the rule obtains in those States in the Union which have simply adopted the common-law, it is also true that *as to every stream within its dominion, a State may change its common-law rule and permit the appropriation of the flowing waters for such purposes as it deems wise.*"

U. S. vs. Rio Grande Irr. Co., 174 U. S., 690, 706, 702.

In Gutierres vs. Albuquerque Land Co., Mr. Justice White said:

"As stated in the opinion just referred to" (U. S. vs. Rio Grande Irr. Co.) "by the Act of July 26, 1866, * * * Congress recognized, as respects the public domain, 'so far as the United States are concerned, the validity of the local customs, law and decisions of courts in respect to the appropriation of water' by the Act of March 3, 1877 * * * the right to appropriate such an amount of water as might be necessarily used for the

purpose of irrigation and reclamation of desert land, part of the public domain, was granted, and it was further provided that 'all surplus water over and above such actual appropriation and use, together with the water of all lakes, rivers and other sources of water supply, upon the public lands and not navigable, shall remain and be held free, for the appropriation and use of the public for irrigation, mining and manufacturing purposes, subject to existing rights.'

That the purpose of Congress was to recognize as well the legislation of a territory as of a state with respect to the regulation of the use of public waters, is evidenced by the act of March 3, 1891 * * *. It may be observed that the purport of the previous acts is reflexively illustrated by the act of June 17, 1902." (Here quoting Section 8 of the National Reclamation Act, supra.)

Gutierres vs. Albuquerque Land & Irr. Co., 188 U. S., 545, 553-4.

In Kansas vs. Colorado, Section 8 of the Reclamation Act of June 17, 1902, above quoted, was before the court upon petition of the United States as intervenor. It was there urged that the Reclamation Act superseded the state laws and gave national control of the streams to the United States. In concluding the discussion and in approving the above quoted language of Mr. Justice White in Gutierres vs. Albuquerque Land & Cattle Co., Mr. Justice Brewer said:

"We do not mean that its legislation can override state laws in respect to the general subject of reclamation. While arid lands are to be found, mainly if not only in the Western and newer States, yet the powers of the National Government within the limits of those States are the same (no greater and no less) than those within the limits of the original thirteen, and it would be strange if, in the absence of a definite grant of power, the National Government could enter the territory of the States along the Atlantic and legislate in respect to improving by irrigation or otherwise the lands within their borders.

* * * * * * * *

But it is useless to pursue the inquiry further in this direction. It is enough for the purposes of this case that *each State has full jurisdiction* over the lands within its borders, including the beds of streams and other waters.

* * * * * * * *

It may determine for itself whether the common law rule in respect to riparian rights or that doctrine which

obtains in the arid regions of the West of the appropriation of waters for the purposes of irrigation shall control. Congress cannot enforce either rule upon any State."

In another portion of the opinion, it is said:

"One cardinal rule, underlying all the relations of the States to each other, is that of equality of right. Each State stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none."

Kansas vs. Colorado, 206 U. S., 46, 92, 94, 97.

The doctrine first announced in the case of Coffin vs. Left Hand Ditch Co., 6 Colo., 443, that the common-law limitation against inter-watershed diversions had been abolished along with the rest of the riparian rules in the arid states, which was later approved and sanctioned in the case of Willey vs. Decker, 11 Wyo., 496, 529-31, is approved by Mr. Justice White in the following language:

"It is conceded on behalf of appellant, that, by the laws of Mexico in force when the Territory of New Mexico was ceded to the United States, the use of the waters of both navigable and unnavigable streams was not limited to riparian lands, but extended as well to lands which did not lie upon the banks of the rivers, and that such use was subject to be regulated and controlled by the public authorities."

Gutierres vs. Albuquerque Land & Irr. Co., supra, 556.

This construction of the doctrine of appropriation was affirmed and approved by Mr. Justice Holmes in the following language:

"*The right to use water is not confined to riparian proprietors.* Gutierres vs. Albuquerque Land & Irrigation Co., 188 U. S., 545, 556; Coffin vs. Left Hand Ditch Co., 6 Colo., 443, 449, 450; Willey vs. Decker, 73 Pac. Rep., 210, 220.

Such a limitation would substitute accident for a rule based upon economic considerations, and an effort, adequate or not, to get the greatest use from all available land."

Boquillas Cattle Co. vs. Curtis, 213 U. S., 339, 347.

The doctrine that waters may be used on non-riparian lands, including those in foreign watersheds, under the rule of appro-

priation, as first announced in Coffin vs. Left Hand Ditch Company, is approved by Judge Hawley, of the Federal Court for the District of Nevada, who was first Chief Justice of the Supreme Court of that state, in a lengthy and exhaustive opinion wherein he likewise assigns the fundamental reasons which led to the abrogation of the common-law doctrine and the adoption of the rule of prior appropriation in the arid states and particularly in Nevada where the principles of prior appropriation had been accepted as applicable to the existing conditions of the soil and climate, in the cases of Jones vs. Adams, 19 Nev., 78; 6 Pac., 442; Reduction Works vs. Stevenson, 20 Nev., 269; 21 Pac., 317. The opinion embodies so complete a summary of the underlying principles of the law of appropriation that we take the liberty of quoting at considerable length.

> "This change is the natural outgrowth of the conditions existing in this state. The climate is dry. The soil is arid. The land is unproductive, without irrigation. When water can be used thereon, it becomes capable of successful cultivation. There are but few streams of water. The benefits accruing to land along the banks of these streams by the mere flow of water in the channel is very slight. *The bottom lands that can be irrigated by a diversion of the water, so that it can be turned back into the stream, are of limited extent.* A large proportion of the area of land suitable for cultivation would have to remain in its wild and unproductive state, covered only by the natural growth of sagebrush and greasewood, unless the right to appropriate and divert the water of the streams *away* from the channel for the purpose of irrigating such lands is recognized and secured. The same conditions exist with reference to the necessity of the use of the water for mining, milling, mechanical, manufacturing, municipal, and other beneficial purposes.
>
> *These conditions and the growing wants and necessities of the people imperatively demanded that such a change should be made.* Riparian rights are founded upon the ancient doctrine of the common law. If the law is a progressive science, courts should keep pace with the progress and advancement of the age, and constantly bear in mind the wants and necessities of the people, and the peculiar conditions and surroundings of the country in which they live. In this connection it has been said to be one of the excellencies of the common law that it admits of perpetual improvement, by accommodating itself to the circumstances of every age, and applies to all changes in the modes and habits of society, and that in this respect it will never be outgrown by any refinements,

and never out of fashion, while the ideality of human nature exists.

* * * * * * * * * * * *

The truth is that under the principles of the common law in relation to riparian rights, if applicable to our circumstances and conditions, there must be allowed to all, of that which is common, a reasonable use. But, if prior appropriation is to prevail, *then different rules must be applied.*

Under the principles of prior appropriation, the law is well settled that the right to water flowing in the public streams may be acquired by an actual appropriation of the water for a beneficial use; that, if it is used for irrigation, the appropriator is only entitled to the amount of water that is necessary to irrigate his land, by making a reasonable use of the water; that the object had in view at the time of the appropriation and diversion of the water is to be considered in connection with the extent and right of appropriation; that, if the capacity of the flume, ditch, canal, or other aqueduct, by means of which the water is conducted, is of greater capacity than is necessary to irrigate the lands of the appropriator, he will be restricted to the quantity of water needed for the purposes of irrigation, for watering his stock, and for domestic use; that the same rule applies to an appropriation made for any other beneficial use or purpose; that no person can, by virtue of his appropriation, acquire a right to any more water than is necessary for the purpose of his appropriation; that, if the water is used for the purpose of irrigating lands owned by the appropriator, the right is not confined to the amount of water used at the time the appropriation is made; that the appropriator is entitled, not only to his needs and necessities at that time, but to such other and further amount of water, within the capacity of his ditch, as would be required for the future improvement and extended cultivation of his lands, if the right is otherwise kept up; that the intention of the appropriator, his object and purpose in making the appropriation, his acts and conduct in regard thereto, the quantity and character of land owned by him, his necessities, ability, and surroundings, must be considered by the courts, in connection with the extent of his actual appropriation and use, in determining and defining his rights; that the mere act of commencing the construction of a ditch with the avowed intention of appropriating a given quantity of water from a stream gives no right to the water unless this purpose and intention are carried out by the reasonable, diligent,

and effectual prosecution of the work to the final completion of the ditch, and diversion of the water to some beneficial use; that the *rights acquired* by the appropriator *must* be exercised with reference to the general condition of the country and the necessities of the community, and measured in its extent by the actual needs of the particular purpose for which the appropriation is made, and not for the purpose of obtaining a monopoly of the water, so as to prevent its use for a beneficial purpose by other persons; that the diversion of the water ripens into a valid appropriation only where it is utilized by the appropriator for a beneficial use; that the surplus or waste water of a stream may be appropriated, subject to the rights of prior appropriators, *and such an appropriator is entitled to use all such waters;* that, in controversies between prior and subsequent appropriators of water, the question generally is whether the use and enjoyment of the water for the purposes to which the water is applied by the prior appropriator have been in any manner impaired by the acts of the subsequent appropriator.

These general principles are of universal application throughout the states and territories of the Pacific coast. They have, in one form or another, been declared, upheld, and maintained by a uniform current of decisions in this state." (Citing the leading decisions from all the arid states, including the citation of Coffin vs. Left Hand Ditch Co., 6 Colo., 443; Hammond vs. Rose, 11 Colo., 524; Atchison vs. Peterson, *supra,* and Broder vs. Water Co., *supra*).

" * * * A person appropriating a water right on a stream already partly appropriated acquires a right to the surplus or residuum he appropriates. * * *

"Under the law of riparian proprietorship, an upper riparian proprietor is entitled to make a reasonable use of a portion of the water of a river to irrigate his riparian land, but he does not have any right to take the water away from the river to irrigate other lands, that are not riparian. * * *

Under the rules of riparian proprietorship, the right to the use of the water in its natural flow is not a mere easement or appurtenance, but is inseparably annexed to the soil itself. It does not depend upon appropriation, or presumed grant from long acquiescence on the part of the other riparian proprietors above and below, but exists, jure naturae, as parcel of the land. It is not suspended or destroyed by mere nonuser, although it may be extinguished by the long-continued, adverse enjoy-

ment of others. It is not affected by the use to which the water has been or may be applied. Use does not necessarily create the right, and disuse cannot destroy or suspend it. * * *

The right to water acquired by prior appropriation is not dependent upon the place where the water is used. A party having obtained the prior right to the use of a given quantity of water, is not restricted in such right to the use or place to which it was first applied. It is well settled that a person entitled to a given quantity of the water of a stream may take the same at any point on the stream, and may change the point of diversion at pleasure, and may also change the character of its use, if the rights of others be not affected thereby." (Citing Colorado and other authorities.)

Union Mill & Mining Co. vs. Dangberg, 81 Fed., 73, 92-5, 106, 115.

It would seem unnecessary to further quote from the federal authorities at this time. As we shall hereafter observe, the general doctrine in its several phases, as announced in the foregoing decisions, is accepted and approved in the following Federal cases from the District of Colorado:

Snyder vs. Colorado Gold Dredging Co., 181 Fed., 62, 69; 10 C. C. A., 136.

Empire W. & P. Co. vs. Cascade Town Co. (C. C. A., 1913), 205 Fed., 123, 127.

Cascade Town Co. vs. Empire W. & P. Co., 181 Fed., 1011, 1013-16.

An inter-watershed diversion for use of water from Stemilt Creek upon lands in the foreign watershed of Squillchuck Creek was treated as permissible by the Supreme Court of Washington. In the opinion the court recognizes the fundamental principles of appropriation as follows:

"The law of appropriation is a creature of necessity. It is a growth peculiar to conditions unknown to the common law."

Miller vs. Wheeler, 54 Wash., 429, 436; 103 Pac., 641.

The same court, in an early decision, made the following announcement:

"The right of appropriation, as defined by the best authorities, is *not* controlled by the location of the stream with reference to the premises which are irrigated."

Offield vs. Ish, 21 Wash., 277; 57 Pac., 809.

Prof. Joseph R. Long, in his very recent (1916) work on irrigation, says:

> "In our examination of the doctrine of riparian rights, we found that the riparian proprietor may use the water of a stream for irrigation only on riparian lands. In this respect there is a wide difference between the right of the appropriator and that of the riparian owner. The right to water acquired by priority of appropriation is *not* in any way dependent on the *locus* of its application to the beneficial use designed.
>
> The water may be used either in the valley of the stream from which it is taken or it may be carried over an intervening ridge to land lying in the valley of another stream, and there used. The water may be diverted to the exclusion of a riparian owner, as will be necessary where the lands to be irrigated therewith are not located on the banks, or in the neighborhood of the stream."
>
> Long on Irrigation (2nd Ed.), page 217; (1st Ed.), p. 92.

The late and learned Clesson S. Kinney, in the last edition of his work on "Irrigation and Water Rights," thus defines the arid region doctrine of appropriation:

> "The Arid Region Doctrine of appropriation may be defined as that doctrine or rule of law which has grown up in this Western portion of our country, governing the use of the water of the natural streams and other bodies, by its appropriation for any useful or beneficial purpose, based upon the physical necessities of the case; and, whereby for the purpose of applying the water to some beneficial use, the water must be diverted from its natural channels, and, *in contradistinction to the strict construction of the common law of riparian rights, the place of use may be on either riparian or non-riparian lands, and the right based upon priority.*"
>
> Kinney on Irrigation (2nd Ed.), Vol. 1, Sec. 587, pp. 1009-10.

In a later chapter, he says:

> *"There is no question now* as to the right of an appropriator to divert the water from a stream flowing in *one watershed* and by any means conduct it for the irrigation of *lands in another watershed.* Yet in an early

case in Colorado the validity of the appropriation and use of the water by this method was questioned, but the Court upheld the right. Under a similar state of facts to those in the Colorado case, the Supreme Court of Washington in a very recent case also upheld the right. Both cases also involved the question of mingling the waters of one watershed with the waters of the stream of another and the right to redivert the water from the latter stream and use the water for irrigation, and the right to do this was upheld.

The *general rule* is that *under the law of appropriation, as contrary to the law of irrigation as a riparian right, the water may be used in any locality, however remote from the stream from which it is taken, or it may be carried over or through the intervening ridge to land lying in another watershed, and there used,* provided that the *vested* rights of others are not injured thereby."

Kinney on Irrigation (2nd Ed.), Vol. 2, Sec. 866, pp. 1521-2.

Under the common-law doctrine, a riparian proprietor cannot divert all of the water of the stream. The rule is thus announced in an early Massachusetts case:

"This rule, that no riparian proprietor can wholly abstract or divert a water-course, by which it would cease to be a running stream, or use it unreasonably in its passage, and thereby deprive a lower appropriator of a *quality of his property,* deemed in law incidental and beneficial, necessarily flows from the principle, that the right to the reasonable and beneficial use of a running stream, *is common to all the riparian proprietors,* and so, each is bound so to use his common right, as not essentially to prevent or interfere with an *equally* beneficial enjoyment of the common right by all the proprietors."

Elliott vs. Fitchburg R. R. Co., 10 Cush., 191, 195.

Under the rule of priority, the contrary obtains, and the first appropriator is entitled to divert such water as may be necessary for the beneficial use for which the same was appropriated, regardless of junior appropriations, and even though it require the entire flow of the stream to supply his prior wants.

This rule was early announced by Justice Helm in a Colorado case in the following language:

"Had there remained water in the stream after such diversion and use by Guiraud, plaintiff in error would

have had the undoubted right to appropriate the same. *But since Guiraud diverted the usual flow of water to the full extent thereof,* plaintiff in error could acquire no absolute right to any part of such usual or ordinary flow, when required by defendants in error; he might divert and use the same at such times as Guiraud and those who held under him were not in need thereof; and when there was an excess over the ordinary flow he might legally appropriate water to the extent of such excess; but when there was not enough for both, the diversion of plaintiff in error must give way to the prior right of defendants in error to the extent of Guiraud's original appropriations."

Thomas vs. Guiraud, 6 Colo., 530, 532.

In the quotation from the opinion of Judge Hawley of the Federal Court of Nevada, the same rule is approved in the following language:

"That the surplus or waste water of a stream may be appropriated, subject to the rights of prior appropriators, *and such an appropriator is entitled to use all such waters.*"

Union Mill & Mining Co. vs. Dangberg, 81 Fed., 73, 95.

The rule is thus announced by Professor Long in his recent (1916) work:

"We have seen that the rights of an appropriator depend solely upon the fact of prior appropriation, and that an irrigator may use all the water, not already appropriated by others, that may be reasonably necessary for the irrigation of his land. Except as against prior appropriators, the rights of an appropriator, unlike those depending upon the fact of riparian ownership, are measured solely by his own needs and actual appropriation, and he is not concerned with the effect of the satisfaction of his own wants on other persons. It follows from these principles that *a prior appropriator may use the entire flow of a stream* for irrigation, provided this is necessary, for the proper irrigation of his land."

Long on Irrigation (2 Ed.), Sec. 132, page 232, and cases cited.

See also Drake vs. Earhart, 2 Ida., 750; 23 Pac., 541.

Mr. Kinney devotes several pages of his recent and

exhaustive treatise on the arid region doctrine of appropriation to this particular topic, and after observing that the doctrine of appropriation was adopted largely on account of the fact that the very limited supply of water in the streams of the arid region was wholly inadequate to supply the almost unlimited acreage of land, says:

> "The rule of priority of right was adopted, in order that the few who were first might live and live well rather than that the many should starve or eke out a miserable existence."

And concludes by saying:

> "Under this principle, the general doctrine is settled by a long line of authorities, * * * that the *prior appropriator* of the waters of a certain stream or other source of water supply, is entitled to the *exclusive use* of the water up to the amount embraced in his appropriation, *even if it cuts off the rights of valid subsequent appropriators.*"
>
> Kinney on Irrigation (2 Ed.), Vol. 2, Sec. 780, 781-4, pages 1355-69.

(3-a) Hoge vs. Eaton Overruled.

The disposition and regulation of the use of waters is a matter of local law with each state and the rules adopted by the constitution, laws and decisions of the courts of each state will be followed by the courts of the United States.

> Kinney on Irrigation (2d Ed.), Vol. 1, p. 1027;
> United States vs. Rio Grande Irr. Co., 174 U. S., 690;
> Gutierres vs. Albuquerque Land & Irr. Co., 188 U. S., 546;
> Clark vs. Nash, 198 U. S., 361;
> Kansas vs. Colorado, 206 U. S., 46;
> Boquillas Cattle Co. vs. Curtis, 213 U. S., 339;
> Schodde vs. Twin Falls Water Co., 224 U. S., 107.

Notwithstanding that the State of Colorado, by constitution, statutes and a uniform line of judicial decisions, has abrogated the common law rule of riparian rights and has adopted the doctrine of appropriation as governing the use of the water of the streams within its borders, and has early declared, in Coffin vs. Left Hand Ditch Co., 6 Colo., 443 and other cases which we have cited, that the appropriator might take the water whithersoever his necessities require and may apply the same upon lands within a drainage area wholly

foreign to the stream of origin, the late Judge Hallett of the Federal District Court of Colorado, shortly before he retired, while considering an inter-watershed diversion from Sand Creek to Sheep Creek involved in the case of Hoge vs. Eaton, used the following language:

> "Water is essential to human life in the same degree as light and air, *and no bounds can be set to its use for supplying the natural wants of man other than the mighty barriers which the Creator has made on the face of the earth.*"

This opinion was rendered February 27, 1905, previous to decision of this court (on May 13, 1907) in the case of Kansas vs. Colorado. While the above quotation may be interpreted as referring alone to the physical inability of the appropriator to overcome natural obstacles, it is naturally interpreted as announcing a riparian doctrine contrary to the uniform rule theretofore adopted and since hitherto followed in the State of Colorado, and is frequently cited as Colorado authority against inter-watershed diversions, and, therefore merits our careful consideration. The manifest error of this language of Judge Hallett is revealed by our many quotations from the constitution, statutes and decisions of the courts of Colorado, already appearing, and we will not unduly prolong this brief with further consideration thereof.

The same judge seems to have committed a similar error in the case of Schwab vs. Beam, 86 Fed., 41, in which he held that Article XVI, Section 6 of the Colorado Constitution does not apply to diversions for manufacturing, mining and mechanical uses, but that as to such the common law rule prevails and also that one who locates a placer claim upon a stream thereby, by implication, makes an appropriation of water, saying:

> "A placer location *ex vi termini* imports an appropriation of all waters covered by it in so far as such waters are necessary for working the claim."

A reading of the decision reveals the fact that Judge Hallett was laboring under the same fundamental error of interpretation of the doctrine of appropriation in both that case and Hoge vs. Eaton.

The case of Hoge vs. Eaton was reviewed by the Circuit Court of Appeals and reversed upon another point (Eaton vs. Hoge, 141 Fed., 64), the appellate court confining its discussion to technical matters and failing to express any opinion upon the erroneous doctrine so announced. The case was subse-

quently dismissed without affording further opportunity of consideration or review by any of the federal courts.

The same erroneous doctrine, announced in the case of Hoge vs. Eaton, was later considered and overruled by the Circuit Court of Appeals in the case of Snyder vs. Colorado Gold Dredging Co., 181 Fed., 62; 104 C. C. A., 136. The reasons there assigned by Mr. Justice Van Devanter are so conclusive of what the opinion of that court would doubtless have been upon further consideration of the case of Hoge vs. Eaton that the language of the court may be taken as overruling that case.

The case of Snyder vs. Colorado Gold Dredging Co. involved an appeal from the Circuit Court of the United States for the District of Colorado, and it was there contended, under authority of the case of Schwab vs. Beam, *supra*, that the location of a placer claim was in and of itself an appropriation of all the waters of the stream upon which the same was located, and that, although no diversion was made for said claim, a right to use the water of the stream attached to it as an incident to and part of the estate included within the patent from the United States. In other words, it was asserted that the common-law rule of riparian rights obtained with relation to patented mining claims situate along a stream by virtue of the fact that the patent carries, by implication, the right to the use of any waters of any stream bordering and traversing the claim.

The court said:

> "The argument is plausible but not tenable. It is in conflict with the established doctrine of appropriation in Colorado and with its recognition and sanction by Colorado as respects the public lands. That doctrine regards the waters of natural streams as entirely distinct from the lands through which they flow, and regards rights to the use of such waters as dependent upon actual appropriation. In these respects *it makes no distinction* between public lands and private lands, *between owners of riparian lands and owners of other lands, between places of use which are adjacent to a stream and those which are remote therefrom,* or between individuals who desire to apply the waters to placer mining and those who desire to apply them to other beneficial uses. Nor does it recognize a merely constructive appropriation or one which rests only on intention. On the contrary its requirements are satisfied only when by union of intent and act the waters actually are subjected to a beneficial use."

The court then quotes with approval the definition of the true test of an appropriation, heretofore quoted from Thomas vs. Guiraud, 6 Colo., 530, 533, and from other decisions of the Supreme Court of Colorado, and continues as follows:

> "True, gold placer claims cannot be worked without water, *but this applies to non-riparian claims* quite as much as to those which are riparian, and water usually is applied to both in substantially the same way; that is, by a ditch which diverts it at a point beyond the limits of the claim and then carries it to the place of use. *Rarely can a riparian claim be worked successfully by the aid of the waters of the contiguous stream* unless they be diverted some distance above the claim, and even then *the volume of water is often so inadequate that it must be supplemented by drawing upon another stream.* Nor are gold placer claims alone in requiring the use of water to render them productive or of value. In Colorado other claims to public lands, such as homestead claims and desert claims, have a like need of water. Indeed, the desert land law (Act March 3, 1877, c. 107, 19 Stat., 377; as amended by Act March 3, 1891, c. 561, sec. 2, 26 Stat., 1096 [U. S. Comp. St. 1901, p. 1549]) conditions the right to make the preliminary entry upon the making of a declaration under oath of an intention to reclaim the land by conducting water upon the same, and conditions the right to make final entry upon the making of satisfactory proof of reclamation by that means; and yet a preliminary desert entry, even if it be of riparian lands, never is regarded as in itself an appropriation of water, any more than is a preliminary homestead entry of non-riparian lands. * * * Considerations such as these point very persuasively to the absence of any good reason for excepting riparian gold placer claims from the doctrine prevailing in Colorado that the waters of all natural streams are subject to appropriation, and that actual application to a beneficial use is the test of appropriation. But it suffices to know that in that state the local customs, laws and decisions of courts make no such exception.

In Schwab vs. Beam (C. C.), 86 Fed., 41, a different conclusion was announced, *but that decision stands alone, is not in accord with the decisions of the Supreme Court of Colorado* respecting the application of the doctrine of appropriation as there prevailing to the use of water for purposes other than irrigation, *and is not sustained by what seems to be the better reasoning.* The

several congressional enactments, whereby the local customs, laws, and decisions of courts relating to rights to the use of water have been recognized and sanctioned, disclose a settled purpose to make the subject one of local law, as respects the public lands and claims thereto under the public land laws; and in none of these enactments is there anything indicative of a purpose to treat riparian gold placer claims differently from other claims. Not only so, but the first expression of this recognition and sanction was incorporated in the mining laws of the United States at the time of their enactment and still remains a part of them. It broadly includes 'rights to the use of water for mining, agricultural, manufacturing, or other purposes,' and leaves no room to doubt that it was intended that the local law should apply to riparian gold placer claims the same as to other claims to public lands. Mr. Lindley, in his work on Mines ([2d Ed.] vol. 1, sec. 428), puts the matter quite accurately when he says:

'As to what rights accrue to a placer locator to the water of a non-navigable stream found within the limits of the location, no definite rule can be stated. It will depend upon the locality in which the claim is situated. If in a state where the ultra doctrine of the common law prevails, his rights to the water would be limited to those of a riparian proprietor. *If in a state where the riparian doctrines are abrogated* or declared never to have been adopted, his right to use the water would depend upon its proper appropriation for that purpose, and the mere location of the placer claim would not of itself confer any right to the water.'

What has been said disposes adversely of the first branch of the contention before stated, and also makes strongly against the second branch, viz., that a patent for a placer claim carries, by implication, the right to the unappropriated waters of any stream bordering upon or traversing the claim. It needs only to be added that, by the settled rule of decision in the Supreme Court of the United States, conveyances by the United States of public lands on non-navigable streams and lakes, when it is not provided otherwise, are to be construed and have effect according to the *law of the state* in which the lands are situate, in so far as the rights and incidents of riparian proprietorship are concerned. Hardin vs. Jordan, 140 U. S., 370, 384, 402; 11 Sup. Ct., 808, 838; 35 L. Ed., 428; Hardin vs. Shedd, 190 U. S., 508, 519; 23 Sup. Ct., 685; 47 L. Ed., 1156; Whitaker vs. McBride, 197 U. S., 510;

25 Sup. Ct., 530; 49 L. Ed., 857; Harrison vs. Fite, 78 C. C. A., 447, 449; 148 Fed., 781, 783. Here it is not provided otherwise, either by statute or by the patent, and, as has been seen, the local law does not recognize a conveyance of the land as carrying any right to the unappropriated waters of the stream."

In a former part of the opinion, the court had announced the appropriation doctrine as it prevails in Colorado in the following language:

"* * * *The common-law doctrine in respect of the rights of riparian proprietors in the waters of natural streams never has obtained in Colorado.* From the earliest times in that jurisdiction the local customs, laws, and decisions of courts have united in rejecting that doctrine and in adopting a different one which regards the waters of all natural streams as subject to appropriation and diversion for beneficial uses, and treats priority of appropriation and continued beneficial use as giving the prior and superior right. Yunker vs. Nichols, 1 Colo., 551; Coffin vs. Left Hand Ditch Co., 6 Colo., 443, 447; Platte Water Co. vs. Northern Colo. Irrigation Co., 12 Colo., 525, 531; 21 Pac. 711; Crippen vs. White, 28 Colo., 298; 64 Pac., 184. In so choosing between these inconsistent doctrines, Colorado acted within the limits of her authority, first as a territory and then as a state, and her choice was recognized and sanctioned by Congress, so far as the public lands of the United States were concerned. United States vs. Rio Grande Irrigation Co., 174 U. S., 690, 702-706; 19 Sup. Ct., 770; 43 L. Ed., 1136; Gutierres vs. Albuquerque Land & Irrigation Co., 188 U. S., 545, 552-554; 23 Sup. Ct., 338; 47 L. Ed., 588; Clark vs. Nash, 198 U. S., 361, 370; 25 Sup. Ct., 676; 49 L. Ed., 1085; Kansas vs. Colorado, 206 U. S., 46, 94; 27 Sup. Ct., 655; 51 L. Ed., 956; Boquillas Land & Cattle Co. vs. Curtis, 213 U. S., 339; 29 Sup. Ct. 493; 53 L. Ed., 822."

From the language of the foregoing opinion so overruling the lower court in the case of Schwab vs. Beam, and announcing that water may be appropriated for use on "non-riparian claims quite as much as those which are riparian" and that sufficient water for this purpose must be frequently obtained "by drawing upon another stream," it is apparent that the Circuit Court of Appeals has expressed its disapproval of the

riparian theories entertained by Judge Hallett and announced in both Hoge vs. Eaton and Schwab vs. Beam, and has overruled the former as well as the latter decision.

That Judge Hallett erroneously construed the laws of Colorado in these earlier cases of Hoge vs. Eaton and particularly Schwab vs. Beam, is likewise recognized by Mr. Kinney on pages 1111 and 3333-4 of his recent work. In Section 1804, on the pages last mentioned, he discusses the abrogation of riparian rights in Colorado and quotes at length the language of the Circuit Court of Appeals in the case of Snyder vs. Colorado Gold Dredging Company, *supra*, in that portion above quoted wherein the rule as announced in Schwab vs. Beam is overruled, and also calls attention to a very recent decision of the Colorado Supreme Court in the case of Sternberger et al. vs. Seaton Mining Co., 45 Colo., 401, 404; 102 Pac., 168, wherein that court forever sets at rest any possible application of the theories announced in Schwab vs. Beam in the following language:

> "The doctrine of this state, that the common law rule of continuous flow of natural streams is abolished, is so firmly stated by the constitution, the statutes of the Territory and of the State and by many decisions of this court that we decline to reopen or reconsider it, however interesting discussion thereof might otherwise be, and notwithstanding its importance. Perhaps a leading case in this state is *Coffin vs. Left Hand Ditch Co.*, 6 Colo., 443."

On page 1111 Mr. Kinney, in a foot-note, thus comments of Schwab vs. Beam:

> "This position is clearly untenable under either the common law rules or the arid region doctrine of appropriation. Under the common law rule there is no 'appropriation' of the waters of the stream, but mere ownership of riparian lands. By reason of this ownership the owner is entitled to a reasonable use of the waters of the stream as an incident to his land * * *. Upon the other hand under the arid region doctrine of appropriation, the mere location of mining claims or the purchase of land upon the bank of the stream is not *ipso facto* an appropriation of the waters thereof. Some act of actual appropriation of the water is required."

Mr. Wiel, in his work written with particular application to the California common law—appropriation doctrine, thus disposes of that portion of Judge Hallett's decision in the case of Schwab vs. Beam wherein he states that "in Colorado, as

elsewhere in the United States, the law is now as it has been at all times, that for such purposes each riparian owner may use the waters of running streams on his own premises, allowing such waters to go down to subsequent owners in their natural channel." (86 Fed., 41.)

> "This seems to show that the decision rested *not* on the principles of appropriation but on those of riparian rights. The placer claimant under the California doctrine, has a right to the use of water in that way but not by appropriation. Schwab vs. Beam would seem to be an attempt to apply the California doctrine in Colorado, a principle which the State court repudiates. The case has been criticised; is contrary to the weight of more recent authority just cited, and is properly overruled." Citing Snyder vs. Colorado Gold Dredging Co., *supra*.
>
> Wiel on Water Rights, 3d Ed., Vol. 1, p. 395.

Judge Lewis, successor to Judge Hallett, overrules the erroneous impression entertained by Judge Hallett to the effect that the riparian doctrine still obtained within Colorado, in his recent 1910 opinion in which he says:

> "The first contention of both complainants is that the government, while it was the owner of the lands on which the canon and the falls are situate, had riparian rights in the stream and that those rights were conveyed by patent from it, their true mesne conveyances, to the complainants.
>
> This contention cannot be accepted. *There are no riparian rights in Colorado* as against the valid appropriation of water."

Judge Lewis then adopts the quotations which we have already given from Sternberger vs. Seaton Mining Co., 45 Colo., 401, 404; Coffin vs. Left Hand Ditch Co., 6 Colo., 443; U. S. vs. Rio Grande Irr. Co., 174 U. S., 690, 702, 704; Gutierres vs. Albuquerque Land Co., 188 U. S., 545, 552; Clark vs. Nash, 198 U. S., 361, 370, and Snyder vs. Colorado Gold Dredging Co., 181 Fed., 62, as a part of his opinion, and concludes by saying:

> "It is therefore believed that the patent from the government did not pass, and the patentee did not take, riparian rights to the waters in question, but that said lands are held by the complainants subject to the law of appropriation of waters as established in this state." (Colorado.)
>
> Cascade Town Co. vs. Empire Water & Power Co., 181 Fed., 1011, 1013-6.

The decision by Judge Lewis in the above case was reviewed by the Circuit Court of Appeals. On April 4, 1913, the case was remanded for further proceedings upon another point and the court affirms that portion of the decision above quoted in the following language:

> "In all other respects the conclusions of the court were in accord with the views we have expressed."

The opinion by Judge Hook reads, in part, as follows:

> "Moreover, the common law of riparian ownership in *all* its features never obtained in Colorado. Snyder v. Dredging Co., 104 C. C. A., 136; 181 Fed., 62. It was unsuited to the region and would have tended greatly to prevent the very development which made the lands valuable. Express recognition of the local conditions and necessities is found in the acts of Congress above referred to and in the patents from which complainant derives its title. See 174 U. S., 690; 19 Sup. Ct., 770; 43 L. Ed., 1136. The National Constitution speaks in the terms of the common law, and that law has been qualifiedly adopted by statute in many states. But there has been no statutory adoption of it for the United States. There its acceptance rests on judicial construction proceeding upon historical reasons and a general sense of suitableness, and like that of the states is qualified to a harmony with our institutions and conditions. It does not automatically apply all over the United States, its territories, and possessions as a blanket of unvarying thickness, but yields here and there to a universal recognition of necessity and propriety. For examples: Our test of the navigability of waters is not that of the common law (The Daniel Ball, 10 Wall., 557; 19 L. Ed., 999); and we have quite generally denied the doctrine of ancient lights. It *would be as illogical to impose the English doctrine of flowing waters upon Colorado as it would be to say judicially that their climate and soil and the imperative needs of their people are the same.* Referring to Montana and Wyoming and the use of waters of non-navigable streams, Mr. Justice Holmes said, in Bean v. Morris, 221 U. S., 485; 31 Sup. Ct., 703; 55 L. Ed., 821:
>
> 'The doctrine of appropriation has prevailed in these regions probably from the first moment that they knew of any law, and has continued since they became territory of the United States.'
>
> And so in Colorado. That rights may vary and be adjusted somewhat to the *imperative necessities* of natural conditions is also exemplified in Clark v. Nash, 198 U. S. 361, 25 Sup. Ct. 676, 49 L. Ed. 1085, 4 Ann.

Cas. 1171, and Strickley v. Mining Co., 200 U. S. 527, 26 Sup. Ct. 301, 50 L. Ed. 581, 4 Ann. Cas. 1174."

Empire Water & P. Co. vs. Cascade Town Co., 205 Fed., 123, 127.

The opinions by the United States District Court and the Circuit Court of Appeals are, to all purposes, affirmed by this court:

> "The right to the use of water is not confined to riparian proprietors. Gutierres vs. Albuquerque Land Irr. Co., 188 U. S., 545, 556; Coffin vs. Left Hand Ditch Co., 6 Colorado, 443, 449, 450; Willey vs. Decker, 73 Pac. Rep., 210, 220. Such limitation would substitute accident for a rule based upon economic conditions and an effort, adequate or not, to get the greatest use from all available land."

Boquillas Co. vs. Curtis, 213 U. S., 339, 347.

It thus appears that the erroneous construction of the Colorado law by Judge Hallett, in Hoge vs. Eaton, has been overruled by his successor, by the United States Circuit Court of Appeals and by this court.

Accident has placed the divides between watersheds or the "mighty barriers" on the face of the earth. The limitation of the use of water in Colorado to the drainage area of the stream, in order that such water might be returned to the stream for use of other riparian owners, would be such a limitation as "would substitute accident for a rule based upon economic conditions, and an effort, adequate or not, to get the greatest use from all available land."

The imperative necessities of Colorado forbid the application of this riparian rule and

> "It would be as illogical to impose the English doctrine of flowing waters upon Colorado as it would be to say judicially that their climate and soil and the imperative needs of their people are the same."

The carrying of water across divides for reclamation of arid lands is, in all essentials, the same, and prompted by the same rule of imperative necessity, as the construction of isthmian canals between great oceans in aid of navigation. Either is in direct opposition to nature and in either case the natural barrier is wholly disregarded in order that the greatest good may come to the greatest number of mankind. The necessities of agriculture in the arid regions are as imperative as those of commerce upon the seas, and it would be just as reasonable and logical to forbid the construction of

isthmian canals in aid of commerce as it would be to deny the right of inter-watershed diversions in aid of reclamation of arid lands. To argue that a sanctity attaches to an isthmus separating two oceans, would be as unreasonable as the argument advanced on page 116 of the brief of counsel for complainant that "each watershed has a natural unity and sanctity of its own" and that "there can be no equitable division of waters between lands or inhabitants within one watershed and those located in other watersheds, which does not recognize the laws of nature and the natural preference which is inherent in the lands and the people of the valley." We fail to find any reputable authority for such argument in any of the many decisions of the state and federal courts of the arid west or in any decisions of this court, and it is evident that any limitations against inter-watershed diversions have been imposed in regions where the common law doctrine of equal (not exclusive) use of the waters of the streams runs alike to all riparian proprietors.

To argue that a "sanctity" attaches to divides between watersheds or to what Judge Hallett terms "the mighty barriers which the Creator has placed on the face of the earth," is as ill-founded as were the early arguments against the construction of the Isthmian canal wherein it was urged that because the Creator had placed the Isthmus of Panama between the Atlantic and Pacific oceans, no man should part it asunder. The United States has constructed the Panama Canal to the benefit of all mankind, and yet it is historically reported as follows:

Philippe Bunau-Varilla, Minister Plenipotentiary of the Republic of Panama, in his work "The Creation, Destruction and Resurrection of Panama," page 19, says:

> "It was not the destiny of Cortez to make that discovery, or that of any other navigator who dreamed of finding the *Secret of the Straits.*
>
> The idea of connecting Nature was mooted, but Phillip the Second forbade any modification of what God had created. The junction of oceans remained in the realm of dreams."

A. Barton Hepburn, in the work entitled "Artificial Waterways of the World," on page 26 states:

> "In the reign of Charles II, the Council of Castile opposed canal plans, as an interference with the wisdom of Divine Providence, which had fixed the waterways."

On page 109 the author states:

"The advantage of such a canal was clearly perceived as early as 1520, when Charles V of Spain is reported to have given it consideration. In 1534 a survey was ordered, but unfavorable reports of the Spanish governor at Panama and probably also his suggestion that such a work would be in 'opposition to the will of the Almighty, who had placed this barrier in the way of navigation between the two oceans,' caused the project to be abandoned; * * * "

The author makes the following note in regard to this statement:

"The medieval religious fervor that dominated the action of Spain in all things, seems ludicrous in the light of present day advancement."

Frederic J. Haskin, in his work entitled "The Panama Canal," on pages 194, 195, says:

"The idea of the canal through the American Isthmus was in the mind of Charles V of Spain as early as 1520. In that year he ordered surveys to ascertain the practicability of a canal connecting the Atlantic and Pacific. His son, Phillip II, did not agree with him about the desirability of a trans-Isthmian waterway, holding that a ship-way through the Isthmus would give to other nations easy access to his new possessions, and in time of war might be of greater advantage to his enemies than to himself. He invoked the Bible to put an end to these propositions to dig a canal across the American Isthmus, calling to mind that the Good Book declared that 'What God hath joined together, let no man put asunder.'"

(*d*) *Plaintiff's Brief.*

Little discussion of this topic, as treated by plaintiff's counsel on pages 112-21 of their brief, is necessary owing to the fact that their whole discussion is predicated upon the erroneous assumption that the common-law doctrine of riparian rights prevails in Wyoming and Colorado, notwithstanding, as we have previously observed, that in Wyoming, as well as in Colorado, the doctrine of appropriation has been adopted for intra-state regulation, and the common law doctrine of riparian rights abrogated by the constitution, statutes and decisions of the courts of each of said states.

We have previously observed that under the riparian doctrine of common-law rights, inter-watershed diversions are, in some cases, prohibited wherever waters so diverted could

not be returned to the stream for the use of other riparian owners, and that the reason for the rule lies in the riparian doctrine that each and all of the riparian land owners have an equal, rather than exclusive, right to the use of the waters of the streams as they flow.

We have also observed that the contrary rule obtains under the doctrine of appropriation where the first appropriator has an exclusive (not equal) right to the beneficial use of the waters of the stream to the extent of his necessities to the exclusion of all junior appropriators and others claiming any waters of the stream, and that his exclusive use may be made upon non-riparian lands including those outside the natural watershed of the stream and that this right to the exclusive use of the water of the streams in order of priority obtains in Wyoming as well as in Colorado.

Counsel open their argument upon this topic with the following statement:

> "We feel bound to concede that the common law doctrine of riparian rights is substantially a world doctrine which has persisted through historical times."

and, after stating that they have been able to find but one case under the *riparian* doctrine wherein such inter-watershed diversion was permitted, state:

> "On the other hand, it seems to be fairly well established that such conduct is not consistent with the rights of *riparian* proprietors where such rights are recognized, and that lands beyond the watershed are *not riparian* to the stream." (Italics ours.)

Several citations, admittedly from riparian states and authors, upon the common law doctrine, are then made as authority for the statement last quoted. Inasmuch as the appropriation doctrine is in derogation of and opposed to the common law rule of riparian rights, it would seem unnecessary to undertake a detailed analysis of these several citations from courts construing the law of states where the riparian doctrine prevails, for the reason that a different rule obtains under the doctrine of appropriation.

Counsel then admit that the underlying reason of these decisions is the fact that water diverted beyond the watershed does not return, in whole or in part, to the parent stream, but fail to state that there is a duty of return under the common law doctrine purely by reason of the fact that all riparian appropriators have the same and equal rights to the use of the water of the stream, while the contrary is true under the appropriation doctrine. They then state that the obligation to return

surplus water is very generally established in the various states by the statutes and decisions of courts and that Colorado alone seems to have dissented from this rule.

The error of this last statement is revealed in the preceding paragraphs of this brief wherein it is observed that the rule prevails throughout the arid region as well as in Colorado, and an inspection of the two citations (I Wiel on Water Rights 282; Hutchinson vs. Watson Ditch Co., 16 Idaho, 484), offered as authority for the statement of the general establishment of the rule in the arid states, reveals the contrary.

The citation from Mr. Wiel, who is recognized as an exponent of the California common law or riparian doctrine, does not bear out the interpretation given it by counsel. The opening paragraph of the section reads:

> "*The necessity for taking the water to distant lands without returning it to the stream* and making the right to water independent of ownership of riparian land aided in giving rise to the rule that the right is independent of ownership of land. *Use on distant land is hence characteristic.* This characteristic use on distant lands involves loss of the efficiency of the water and is a necessary evil of the law of appropriation."

The case of Hutchinson vs. Watson Ditch Co., *supra*, is not in point and does not involve the return of any water back to the stream. In that case parties diverted water from Snake River through an intermediate side-channel or slough which constituted a natural watercourse. They took the water from Snake River into and along this slough to their headgates where they diverted it for use upon their lands. It became their custom to shut the water from their ditch by closing the mouth of the slough at Snake River rather than by closing their headgate from the slough, and in so doing they prevented the water from passing down the natural slough or watercourse by the lands of the plaintiff, as they would have flowed if the defendants had shut the water out at the headgate of their ditch instead of at the mouth of the watercourse. No question of return to the stream of waters once diverted for irrigation was involved, but purely the question as to whether or not they had a right to obstruct a natural watercourse when not using or diverting any water for irrigation. The court says:

> "When they were not needing it or using it for carrying out or fulfilling the purposes of their appropriation, they were not content to allow it to flow in the natural channel of the stream where any and all might freely use it or acquire a right by appropriation and diversion, but they entirely cut off the source of supply and di-

verted it into another stream so that it could not flow in its natural stream. * * * This case must be considered independently of the question of appropriation and diversion. * * * As we have before seen, the common-law doctrine of riparian proprietorship, *whenever it comes in conflict with a water right acquired by appropriation*, is thus in conflict with and repugnant to the constitution and statutes of this state."

The court then decides that when the appropriators are making no diversion at all, they have no right to obstruct the stream and uses the following language:

"While appellants have acquired by location and appropriation the right to carry and convey waters through this slough and natural stream and waterway to the full capacity of the stream for irrigation purposes, and for those purposes may control the stream in so far as it is necessary to keep the same open and in repair, * * * still they have no right to entirely divert the water from the stream and turn it to waste down another stream or into another channel at such times as they are not using the water or exercising their rights under their appropriation * * * when they can not or will not use it they must allow it to flow in its natural channel, undisturbed, for the use of any other persons who may have a subsequent or inferior right to appellants or who may desire to acquire such right by appropriation or use."

See also,

Schodde vs. Twin Falls Water Co., 224 U. S., 107. 125.

Counsel next make the statement that in Colorado "it is not permitted to change the use under an appropriation once established, so that the surplus water will not return to the stream" and cite as authority therefor the decision of Fort Collins M. & E. Co. vs. Larimer and Weld Irr. Co. (Colo.), 156 Pac., 140, 143. A reading of the opinion in that case will reveal that the statement of counsel speaks but half the truth. In that case an attempt was being made to transfer the point of diversion from an old ditch with a large appropriation but theretofore used for a small acreage of land and from which the major portion of the water diverted had returned to the stream and constituted a source of supply of the stream at the time the rights of a junior appropriator attached. It was asserted

that making a change at the point of diversion and conveying the amount of water specified in the decree to distant lands, where it would all be consumed, would constitute an enlarged diversion and a depletion of the supply of the river to the extent of the enlarged use to the detriment of a junior appropriator. No question of inter-watershed diversion or return of the water after use to the original source of supply, like the one here in controversy, was there involved. It was purely a contention between a junior and senior appropriator involving the question of the right of the senior appropriator to cut off, by enlarged use, waters which had become tributary and a source of supply of the stream before the rights of the junior attached.

Counsel then cites the case of Montrose Canal Co. vs. Loutsenhizer Ditch Co., 23 Colo., 233, as authority for the statement that Colorado

> "pays tribute to the natural integrity of the watershed by certain constitutional provisions referring to certain natural use of riparian owners to the right to deplete the stream by appropriation."

It again happens that the citation is not in point. Counsel evidently confuses certain provisions of the Wyoming constitution with Section 6 of Article XVI of the Colorado constitution. In the latter, provision is made for three general classes of use which the Colorado court in a later case has construed as merely giving a right of condemnation to the higher as against the lower use (Town of Sterling vs. Pawnee D. & E. Co., 42 Colo., 421, 426), in which case the Montrose Canal Co. vs. Loutsenhizer is discussed. The natural integrity of a watershed is in no manner involved in either case, and neither can be cited as in any way modifying the rule of appropriation as it obtains in arid states.

Principal reliance seems to be placed in Mr. Wiel's work on Irrigation and Water Rights and upon a number of California decisions. We have already noted that Mr. Wiel is regarded primarily as an exponent of the riparian doctrine as construed in California where appropriation is only permitted when not in conflict with riparian rights. (See Kinney on Irrigation, 2nd Ed., Vol. 1, p. 1034-6.) The doctrine of appropriation there obtained as elsewhere until the decision of Lux vs. Hagan, 69 Calif., 255, since which time preference has been given riparian rights until quite recently, when the court, in the case of Katz vs. Walkinshaw, 141 Calif., 116, has again modified the rules theretofore announced and adheres to the rule that the necessities of the country, rather than the ancient rules of common law, must govern.

Kinney on Irrigation, (2nd Ed.) Vol. 1, p. 1023-5. See also chapter "Arid Region Doctrines of Appropriation," chapter 31, pages 1005-36.

It is here interesting to note that in construing the following statute:

> "The water appropriated may be turned into the channel of another stream and mingled with its waters and then reclaimed; but in reclaiming it, the water already appropriated by another must not be diminished."

Sec. 1413, Calif. Civil Code of 1872.
Deering's Ann. Code & Stat. of Calif. (1886), Vol. 2, p. 267, Sec. 1413.
Pomeroy's Codes of Calif. (1901), Sec. 1413, p. 405.

The Supreme Court of California referred to two cases involving inter-watershed diversions wherein they treated such diversions and the mingling of the foreign waters as entirely proper.

Eddy vs. Simpson, 3 Calif., 249.
Hoffman vs. Stone, 7 Calif., 426.
See also Butte Canal & Ditch Co. vs. Vaughn, 11 Calif., 143.

The first two of these cases are properly read together. In the latter case, Chief Justice Murray, after stating decisions involving the right to appropriate waters had been based upon the wants of the community and the peculiar conditions in the state, says:

> "The fact early manifested itself, that mines could not be successfully worked without proprietorship in waters and it was recognized and maintained. To protect those who, by their energy, industry and capital, had constructed canals and races, *carrying water for miles into parts of the country which must otherwise have remained unfruitful and undeveloped*, it was held that the first appropriator acquired special property in the waters thus appropriated."

The above California statute, with its early construction by the Supreme Court of California, was later adopted by Idaho (Revised Code of Idaho, Sec. 3244). It will be noted that the decisions of the California court are prior to the case of Lux vs. Hagan.

Decisions are also cited from New York, North Dakota,

South Dakota, Nebraska, Kansas and Texas, in all of which the courts have declared the common-law doctrine of riparian rights applies, somewhat modified in connection with the use of water for irrigation.

Long on Irrigation (2nd Ed.), Sec. 10, p. 20.

The decisions of these courts are therefore not in accord with the appropriation doctrine of the arid states as adopted by both Wyoming and Colorado. The same observation will obtain with relation to the case of Sturr vs. Beck, 133 U. S., 541, applying the common-law doctrine as adopted in Dakota, and Winters vs. U. S., 207 U. S., 564, involving water rights upon Indian Reservations, the title to which had not yet passed to Montana, one of the states adhering to the riparian doctrine as applied in California.

The erroneous construction by counsel of the laws of Mexico is evidenced by:

U. S. vs. Rio Grande Irr. Co., 174 U. S., 690.
Gutierres vs. Albuquerque Land Co., 188 U. S., 545.
Boquillas vs. Curtis, 213 U. S., 339.

See also—

Kinney on Irrigation (2nd Ed.), Vol. 1, Secs. 576-84, pages 987-1003, for complete discussion of Mexican laws.

Counsel unfortunately confuse the common law rule with the opposite appropriation rule, with relation to the return of waters to the stream (p. 117). At common law it was the duty of the riparian owner "to return all that is not needed for such use" to the stream in order that other riparian owners might obtain a like use of the same water (Long on Irrigation (2nd Ed.), Secs. 65 and 66, pages 117-20), but under the appropriation doctrine no such rule obtains and the appropriator may convey the water "whithersoever necessity may require for beneficial use, without returning it or any of it to the natural stream in any manner."

Oppenlander vs. Left Hand Ditch Co., 18 Colo., 142, 149.

Kinney on Irrigation (2nd Ed.), Vol. 1, Sec. 587, pages 1009-10.

Under the riparian rule, the water could only be diverted for reasonable and non-consuming use, and any use which would consume the stream was prohibited in that no return of the

water could be made for other riparian owners with equal rights. Under the rule of appropriation, the owner of the ditch, as we have heretofore observed, may, if his needs require, consume the entire flow of the stream to the exclusion of all riparian owners and all junior appropriators. The essential difference between diversions under the two doctrines is that in the former the diversion was made with a specific intent and legal prerequisite that the water should be again returned to the stream before it should leave the riparian lands of the owner, while, with the latter doctrine, the appropriator must not divert more than enough water to satisfy his needs and must shut back and leave the remainder of the water in the stream for other appropriators. As said by the Colorado Supreme Court:

> "A right to the use of water is limited in time and volume to the extent of the needs of the party in whose favor such right is established for the purpose named."
>
> White vs. Nuckolls, 49 Colo., 170, 177.

In fact, the whole theory of exclusive right of the appropriator is predicated upon the limitation that he must not divert any more water from the stream than is required by his needs, and that all other waters of the stream must pass to other appropriators who have like rights in their order of priority. This limitation is *read into* the right and the water officer is authorized to shut out from the appropriator's ditch any water in excess of that required for his beneficial use.

The observations of counsel on page 121, to the effect that the riparian laws of Dakota may have some possible bearing upon the rights of Wyoming appropriators, is set aside by the decisions of this court, as well as by reason of the fact that none of the few small appropriations which existed on the Laramie River in Wyoming prior to its admission as a state are in any way here involved, and no possible injury can result thereto by the diversions in Colorado. (See separate portion of brief, "Priority of Appropriation.")

Pollard vs. Hagan, 3 How., 212.
U. S. vs. Rio Grande Irr. Co., 174 U. S., 690.
Gutierres vs. Albuquerque, 188 U. S., 545.
Kansas vs. Colorado, 206 U. S., 43.
Boquillas Cattle Co. vs. Curtis, 213 U. S., 339.
U. S. Freehold Land & Immigration Co. vs. Gallegos. 1 Legal Adviser, 412.
Snyder vs. Colorado Gold Dredging Co., 181 Fed., 62, 65, 69.
Kinney on Irrigation (2nd Ed.), Vol. 1, Sec. 593, pages 1025-9.

The rights here in controversy are not, as at common law, merely an incident to and a part and parcel of lands which, by accident of nature, happen to be fortunate enough to border on the stream. The distinct, exclusive, usufructuary estate acquired by an appropriator is *property of the highest order* which is protected by law as such and subject to all the incidents of property. The property in such a water right consists not alone in the amount of water claimed, but also in the priority which often is its chief value. It has none of the characteristics of personal property. It is real property. It is an inheritable estate and passes to the heirs or devisees. It is conveyed with the same formalities as any other real estate. It is a property right independent in itself, based upon application of the water to beneficial use, and is not subordinate to any land, but exists independent of the ownership of land or of the channel of the water-course.

Kinney on Irrigation (2nd Ed.), Vol. 2, Chap. 41, pp. 1311-43.

And for counsel to now contend that Wyoming may enforce upon Colorado, contrary to her will, the riparian doctrine of return of water to the original stream, is for them to deny the constitution, laws and decisions of their own state, Wyoming, and to declare that the doctrine of appropriation does not there prevail.

The constitution, statutes and decisions of the courts and the quasi-judicial tribunals of Wyoming are in direct conflict with and are sufficient reply to the argument of counsel. If the common law rule of riparian rights obtains in Wyoming, irreparable injury will occur to the best agricultural regions of that section, as well as in Colorado.

(e) *Conclusion.*

We believe sufficient authority appears to justify the following conclusions: That the common law doctrine of riparian rights has been entirely abrogated in the arid region of the United States and that the doctrine of appropriation has been adopted by each of the states therein for intra-state regulation and control of the waters of the streams flowing within the borders of each of said states; that under the doctrine of appropriation, the first appropriator within each such state, obtains an exclusive right to the waters of the stream to the extent required for beneficial use and even to the entire flow thereof if his necessities so require, without regard to the rights of junior appropriators or of persons owning lands riparian to the stream; that in adopting the rule of appropriation, each

of the states abrogated the common law rules of equal rights of all riparian land owners including all right to return of diverted water to supply such equal rights of other riparian owners and that under the doctrine of appropriation diversion may be made whithersoever necessity may require for the irrigation of lands wherever situate, whether within or without the drainage area of the stream, and that this doctrine applies within each of the states of Wyoming and Colorado.

PART II.

PRIORITY OF APPROPRIATION.

DISCUSSION OF THIS GENERAL SUBJECT WILL BE SUBDIVIDED AS FOLLOWS:

I. OPENING STATEMENT

(1) METHODS OF INITIATING APPROPRIATIONS:
In Colorado
In Wyoming

II. PRIORITY A QUESTION OF FACT

V. GENERAL CONCLUSION

VI. WYOMING'S DISREGARD OF COLORADO PRIORITIES

I. OPENING STATEMENT.

While either Colorado or Wyoming may at any time otherwise legislate, for the present they have both adopted what is known as the "Colorado doctrine" (as distinguished from the "California doctrine") of appropriation for intra-state regulation of diversions and use of water from the streams within their respective boundaries. While this doctrine at present applies to distribution of water *within* the borders of each state, we contend that it does not apply to the use and distribution of water between the states for the following reasons:

The sovereignty of each state is in all respects equal with that of the other and with any of the original thirteen states of the United States;

Each state has full jurisdiction over the lands within its borders, including the beds of streams and other waters;

Either state may change its doctrine in any manner, to any degree and as frequently as it may desire. Either may adopt the riparian doctrine tomorrow, a mixed doctrine, such as prevails in California, on the day following, and again another and a still different doctrine, without the slightest regard to the neighboring commonwealth;

Neither state has a right to impose her present or any future adopted doctrine upon her neighboring state;

The fact that the two states happen at the present time to recognize the same doctrine does not amount to extra-territorial recognition by the other state;

Distribution of water by priority of appropriation upon interstate streams, regardless of state boundaries, would involve the interference with property of citizens of one state by officials of another state and contravention of the sovereign rights of both, and would do violence to the rule of equality of states.

The doctrine is impossible of administration. While the officers of each state have full authority and control of the distribution of water according to decreed rights within the state, the restriction of use to necessities of the user, the prevention of waste, the substitution or exchange of water between appropriators or between reservoirs and ditches or vice versa and the execution of the many duties essential to obtain the maximum beneficial use of the limited available quantity of water, nevertheless this authority and jurisdiction ceases at the state line. Colorado has no jurisdiction in Wyoming and Wyoming none in Colorado. Neither state can impose its will upon the other. Who then is to adminster the distribution of the waters between the states? No state or federal official has such power. Furthermore, the performance of such duties would of necessity supersede the authorities of each commonwealth and in turn each state would lose entire control over the distribution of all interstate

and tributary waters within its borders and in case of states situated as either Colorado or Wyoming, with waters almost wholly interstate, entire control would be lost over all the streams. The laws of either state would cease to operate. Her statutes would become mere mockery. Another doctrine than that of her choosing would be forced upon her without right of change or amendment and her rights as a sovereign would become mere fiction.

The doctrine is impossible of administration for a further reason, that in no two localities or states along an interstate stream are the conditions the same, and an interstate stream passing through several states under several jurisdictions and under varied conditions must needs be regulated by different rules along its course.

The Colorado River rising in Colorado and Utah, flows more or less through six different states from its various sources to the sea. Through portions of the United States separated by mountain chains and natural obstacles, it traverses in excess of one thousand miles by meander. What human mind is capable of properly distributing its water according to priority among the appropriators of the six different states and at the same time limiting each right to its purely beneficial use without waste, making exchange between appropriators and generally conducting the administration of the distribution of this water throughout the great areas and over the great mountain chains covered by this interstate stream?

The application of the doctrine would subject the states and their development to chance or accident and make the fate of each commonwealth a lottery irrevocable. To illustrate: the gold excitement happened to cause the regions nearest the Rocky Mountains to first develop the use of water for irrigation. The Great Plains, sloping easterly from these mountains and constituting a considerable portion of both Wyoming and Colorado, are extremely arid and require irrigation to sustain life and agriculture. By chance alone this earlier irrigation occurred in the regions adjacent to the mining districts. It needs but a glance to determine what would have been the fate of either Wyoming or Colorado, under application of the doctrine, had no minerals been early discovered in the Rocky Mountains and had the agricultural development, following lines of natural opportunity, advanced gradually westward from the humid to the semi-arid, from the semi-arid to the arid regions, absorbing and appropriating the water from the stream with the trend of progress. In such event, either of the litigant states would have been forever deprived of even the smallest use of her streams, and would have been doomed to eternal aridity where now thriving communities support local, state and national governments.

To use another illustration: the lands in one state are withheld from settlement by forest reserve, Indian reservation, or some other cause, and remain undeveloped for a long period, during which the waters of the streams arising within that state, necessary to reclaim these lands, are all appropriated in a neighboring state where development has progressed during the time the lands in the other state were withheld. When the obstacles are removed, the state of origin of the water would find herself forever barred from the use of the water of her streams in the development of her lands which must forever lie arid while she perpetually gives to the foreign state, without return, the water necessary for the development of her own area. While, as between citizens dwelling *within* these states, necessity has compelled the adoption of the doctrine of right by priority of appropriation, on the other hand, necessity likewise forbids the leaving of future development of states to chance of first appropriation, and to so permit a foreign state to forever prevent any development within the state of origin of the very water upon which the lower state fattens, would be contrary to the law of nations, and were it not for the Constitution, would be sufficient cause for the upper state to sustain her own existence and the right to use at least an equitable portion of the waters within her borders by force of arms, arbitration or other adjustment with her neighbor.

Each state is entitled to administer her water as she may elect, regardless of any other state, or, at least, is entitled to the use and benefit of an equitable portion of the waters of her interstate streams. Any other doctrines do violence to the inherent right of the commonwealth to develop her own territory, use her own natural resources, and sustain and protect her people on a basis of equality with every other state of the Union. What is an equitable portion of the water of an interstate stream must ever depend upon the facts and circumstances of each case and cannot perforce be determined by the lottery of first settlement and appropriation.

Notwithstanding what we have said, priority is an issue joined in this case, and to meet that issue considerable evidence was introduced, not so much by the plaintiff to sustain the issue, in which we believe it signally failed, as by the defendants to forever conclude any possible contention. While we contend that the doctrine of priority of appropriation has no place in this action between sovereign states, nevertheless, out of ample caution and with a desire that the case may be fully and fairly presented, we shall discuss at length the various diversions from the Laramie River in both states.

(1) Methods of Initiating Appropriation.

While right by priority of appropriation at present prevails in both Colorado and Wyoming, the methods by which these appropriations are initiated, perfected and finally approved, are essentially different in the two jurisdictions. (3348-52.)

In Colorado: The water right is initiated by the first act which leads ultimately to beneficial use. This may begin with survey or actual construction. The appropriator may make a filing with the State Engineer (formerly with the county clerk and recorder) for the purpose of giving notice of the intended appropriation and preserving a record of his enterprise, or he may omit to make the filing and prove his priority by other methods. The appropriation is fixed, both in date of priority and amount, entirely by the district courts under procedure prescribed by statute, and all decrees limit the right of diversion to beneficial use and prohibit waste and excessive diversion. Priorities of appropriation are determined in Colorado exclusively by the courts and not by quasi-judicial officers. No permit to divert water is necessary, each appropriator having the right to go upon the stream and construct his diversion system in manner and extent as he may desire and without previous sanction or adjudication by any official.

In Wyoming: An appropriation is initiated by the filing of an application for a permit. This is a prerequisite before commencing construction, enlargement or extension of any ditch or diversion system or performing any work in connection therewith. The State Engineer endorses on the application the date of its receipt and notes the same in the records of his office. If, in due form, he then determines (1) whether or not the proposed diversion and beneficial use will impair *existing rights,* and (2) whether there is *unappropriated water* in the stream to supply the proposed enterprise. If, upon his quasi-judicial determination, it is found that there is no unappropriated water, or where the proposed use conflicts with existing rights or threatens to prove detrimental to public interest, he has power to reject the application and the appropriator is forbidden to proceed with the construction of the enterprise.

If, however, the State Engineer officially determines that there is *unappropriated water* in the stream from which the proposed diversion is to be made, he grants a permit for the construction of the enterprise upon such conditions and limitations as he may impose, whereupon the appropriator may proceed to construction in conformity with the application and the limitations imposed by the State Engineer and not otherwise. The application is accompanied by maps and plats showing accurately the extent and location of the proposed work

and the rights of the appropriator are defined by the application and the permit.

The priority of each Wyoming appropriation dates from the filing of the application in the engineer's office.

The permit authorizes the diversion of water whereby the appropriator makes his beneficial use. His rights are finally adjudicated and decreed by the Board of Control, consisting of the State Engineer and the various superintendents of the water divisions of the State. The findings and determinations of this Board of Control in Wyoming are similar in legal effect to the decrees of the district courts in Colorado. An appeal lies from the decree of the Board of Control to the District and Supreme Courts.

The limitations imposed in the permit and in the final decree define the priority and extent of the appropriation. There can be no greater appropriation in Wyoming than those fixed by each permit and decree.

The State Engineer of Colorado has no judicial or quasi-judicial powers such as are vested in the State Engineer of Wyoming. In Colorado the appropriator constructs his ditch and makes his appropriation without previous permission. In Wyoming he must have the permit from the state. In Colorado the appropriation dates with the beginning of work or survey and is completed by application of the water to beneficial use, and the District Court simply confirms and quiets by decree the rights of the appropriator as the facts may warrant. In Wyoming, beneficial use is a prerequisite to the final decree by the Board of Control and the right relates back to the date of the filing of the application for permit and the appropriation is, in effect, granted its priority in advance.

In Colorado the appropriator determines for himself the question of available water supply. In Wyoming this fact is determined in advance by the State Engineer.

II. PRIORITY QUESTION OF FACT.

Priority of appropriation is, of necessity, a question of fact settled within each state by courts or tribunals having jurisdiction so to do: (1) In Colorado by the district courts and (2) in Wyoming by the state engineer in filing and passing upon the application for permit and subsequently by the Board of Control in granting final certificate or decree.

The statutes of each state control relation of the priority to some initial date, in Colorado to the date of the beginning of the first work (survey or construction), and in Wyoming to the filing of the application for permit with the state engineer.

The priority of the enterprise on completion and applica-

tion of water to beneficial use, reasonable diligence having been used, relates back to the initial date. What constitutes reasonable diligence is likewise a question of fact depending upon the circumstances connected with each particular case. (Kinney on Irrigation, Vol. 2, page 1278.) The whole subject of priority being largely a question of fact, it is necessary to review the evidence at considerable length in arriving at the relative rights of the private appropriators taking water from the Laramie River within the two litigant states. Consideration of the subject is tedious and repetition is frequently necessary. We shall omit small diversions or those earlier diversions whose rights, it is evident, are in no wise materially involved, or shall pass them with brief notice. The material diversions will be considered by states.

We shall consider (III) diversions and use of water from the Big Laramie River in Colorado, the state of origin of that branch of the general stream, and (IV) diversions from the Laramie River as it flows through Wyoming.

III. COLORADO APPROPRIATIONS.

In considering diversions and use by Colorado and her citizens (all within her territory), we will speak of (1) diversions and use on the limited area along the narrow valley of the Big Laramie as it rises and flows through Colorado, (2 and 3) inter-watershed diversions made long prior to the Greeley-Poudre enterprise for irrigation of lands now in a high state of cultivation in Colorado, and (4) the Greeley-Poudre enterprise.

(1) Meadow Ditches.

There are numerous small appropriations along the narrow valley of the Big Laramie River in Colorado. These are used exclusively for the irrigation of narrow strips of meadow, aggregating but 4,250 acres (3458), and from which the water returns rapidly to the stream. The same is true on the upper reaches of the Little Laramie in Wyoming, and throughout this case these diversions at the head-waters of these two branches of the stream have been treated by all the experts as off-setting one another and as unworthy of serious consideration in this case (1271, 1274, 3458, 3460-1, 3463-5). These minor appropriations will be omitted.

(2) Sky Line Diversion.

In 1891 the Sky Line Canal of the Water Supply & Storage Company was initiated, diverting water from the head waters

of the Big Laramie in Colorado across the Green Mountains and over into the Cache la Poudre River for use in the irrigation of lands immediately adjacent to and in all respects similar to the lands of the Greeley-Poudre Irrigation District hereinafter mentioned.

(3) Sand Creek Diversion.

Subsequently, but long prior to any project here in controversy, the Divide Canal and Wilson Supply Ditch, working in combination as one system, were constructed for the diversion of water from the upper reaches of Deadman Creek over into Sand Creek, both rising and flowing in Colorado, and thereafter for re-diversion from Sand Creek into Sheep Creek, a tributary of the Cache la Poudre River, for use upon lands immediately adjacent to those served by water diverted from the Laramie River by the Sky Line Canal of The Water Supply & Storage Company.

(4) Greeley-Poudre Appropriation.

August 25, 1902, the Laramie River portion of the enterprise of the Greeley-Poudre Irrigation District was initiated. It consists of a tunnel through the Green Mountains from the Big Laramie to the Cache la Poudre (herein described as the "Greeley-Poudre" tunnel) and a system of diversion and collection ditches and reservoirs on the Laramie River for storing and conveying water to the tunnel (1935, 2039, 3933, Exhibit 179—Decree District Court Larimer County). There is one diversion and collection ditch on the east side of the Laramie valley known as the "East Side Collection Ditch," and two such canals on the west side of the valley, one high up at timberline, known as the "Upper Rawah" or "Rawah" Ditch, and the other lower down in the valley and known as the "Lower Rawah" or "West Side Collection" Ditch.

Actual survey of the enterprise did not begin until August 25, 1902, although there had been previous preliminary reconnaissance (1933-5, 2039). Priority as of this date is asserted and has been awarded the project by the District Court of Larimer County, Colorado, in its decree entered in adjudication proceedings for the water district including that portion of the Laramie River in Colorado (Ex. 179, 3933).

In discussing the system, we will subdivide the subject as follows:

(a) The region in which the construction has proceeded and the natural and other obstacles necessarily encountered;

(b) The initial acts upon which the priorities of the enterprise were established and the subsequent progress down

to March and April, 1908, when the large, new and junior projects in Wyoming were initiated (in whose behalf this suit is brought); and,

(c) Progress subsequent to April, 1908.

(a) The Region.

The Laramie River portion of the enterprise is situate in a remote, inaccessible, heavily timbered mountain region, nearly at timberline, amid perpetual snow, where winter prevails the greater portion of the year (1894), and work is limited to a very short period during each summer season (792-6). Remoteness from railroad centers necessitates wagon freighting of labor, supplies and machinery from 70 to 100 miles through the mountains. Progress is slow and very expensive under such conditions and years are required to construct the same character of works that could be completed in months upon the plains. Construction is largely in solid rock and its cost is several times that of similar work in plains regions (792-6, 1404-5, 1619-20, 1754-6, 1777-9, 1895-8, 1912, 1920-3, 2076-8, 2239-40).

One of the Wyoming engineers describing similar work, more favorably situate, at the head waters of the Little Laramie River, says:

> "The period for favorable construction work at that altitude is between June 1 and November 1. Prior to June 1 there is too much snow and the ground is waterlogged and a spring is under every rock, and in September the winter snows begin. * * * Work then ceases. * * * We had innumerable difficulties in connection with that work. In addition to the climatic conditions that have to be contended with, the country is hard of access at any time of the year. Practically no roads can be traveled with an ordinary load and team of horses. * * * Comparing this work with a similar construction and excavation of material in an open country if the same kind of construction that is on Douglas Creek was done within five miles of the City of Laramie, it would require about one-fourth the time." (792-3.)

This is the statement of the engineer for the Laramie Water Company, in charge of construction of the Douglas Creek interwatershed diversion in Wyoming where the waters of that stream are to be conveyed across the divide and into the head waters of the Little Laramie as a part of the Lake Hattie system, which we will hereafter consider. A reference to his testimony will show that this work is only six miles, while the Gree-

ley-Poudre is more than seventy miles, from the nearest railroad point.

The Colorado witnesses, in the references given, state, in part, as follows:

Professor Carpenter says:

> "The most difficult and expensive development undertaken is probably in the class of trans-mountain diversions. Here it is necessary to build canals in regions remote from labor, materials and markets, through comparatively unoccupied territory and over lines where a large part of the work is through rock and along steep hillsides, where seasons suitable for construction of canals are short and labor hard to obtain, where the most substantial construction is necessary and where the utmost care must be exercised in the selection of the route and the performance of the work. The ice and snow conditions of winter must be provided for and guarded against and tunnels of greater or less extent are generally necessary.
>
> The Greeley-Poudre District has about 20 miles of collecting ditches along steep hillsides, largely in rock, and the construction of the Greeley-Poudre tunnel 2½ miles in length, required the transportation of labor and materials by men and teams for a distance of about 78 miles from Laramie, Tie Siding or Fort Collins. It was an engineering feat worthy of the attention of the best engineering talent and required the expenditure of a large amount of money and time.
>
> While the time consumed in the actual construction of the tunnel was not great, its location and necessary preliminary examination of almost the entire mountain region to determine the probable water supply and the raising of capital, necessarily consumed a number of years." (1404-5.)

John R. Wortham, engineer, says:

> "Surveying and construction in that region is limited to a short period during the summer season. The season is very short * * * and it is impossible to haul supplies in there during any but the summer months. * * * After that the snows come in very heavy and it is impossible to get supplies in there in order to carry on construction work. * * * Supplies have to be hauled from the railroad points on wagons * * * about 80 miles from Fort Collins or Laramie, Wyoming." (1619.)

Charles R. Hedke, formerly construction engineer for the enterprise, said:

"* * * Laramie River system is in a region inaccessible; supplies, etc., must be hauled by wagon. Material encountered is of character much harder to work than upon plains and cost is many times more, and from the nature of things surrounding that class of construction, it is impossible to do that work in anywhere near the same time that similar work is done down on the plains.

Shortness of working season in mountains creates an obstacle in the way of speedy construction. The character and class of workmen required usually employed on such work must be found and there is much loss of time in beginning of each season's work on such construction. Working season closes early in fall. That necessitates entire abandonment of forces when work is shut down and reorganization in the spring.

* * * *To compare a mile of mountain ditch with a mile of similar canal in the plains district by difference in cost, a ditch of the same capacity on the plains as our mountain ditches would cost in the neighborhood of $1,000 per mile. Up in the mountains it would cost $30,000 per mile and a mile of plains ditch can be built in a matter of several weeks, while a mile in the mountains may take a year*, requiring nearly all the men you can get on that mile to construct it in one season's work.

Work can be carried on throughout the entire year on the plains. Mountain construction entails a certain knowledge of handling that class of material, requiring powder and drilling, and consequently a class of men that are more experienced and expert. Ordinary labor obtained for driving teams on plains ditch construction is impractical on mountain construction. * * * The Sky Line Ditch was contemplated and under construction for several years and has been under reconstruction almost continually since, covering a period from 1890 to the present time." (1777.)

"Cost of transportation of materials from supply station at base of mountain on the Laramie River to the Upper Rawah Ditch was as great as cost of transportation of material from Fort Collins or Laramie to this supply station. The distance in the first instance is seven miles, while in the latter it is 65 or 70 miles. The principal reason * * * is the grades to overcome, the difference in elevation being about 2,000 feet in three

or four miles and requiring six horses for hauling a ton of material.

We had a fixed wagon freight rate from Fort Collins and Laramie to the supply station on Laramie River. * * * The rate was $1.10 per 100 lbs. to that point with $1.00 per hundred from there on to the construction camp at the Upper Rawah Ditch.

Fort Collins, Colorado, and Laramie, Wyoming, were nearest railroad stations.

Laborers were taken up at the same rate as freight; they were weighed and hauled by weight." (1756-7).

The comparison between the Greeley-Poudre work and the mountain work on the headwaters of the Little Laramie on the inter-mountain water diversion of The Laramie Water Company in Wyoming, the difficulties encountered in the construction of which are described by Engineer Bishop, from whom we just quoted, is easily ascertained by comparison of the wagon freight rates. On the Greeley-Poudre system the rate was from $1.15 to $2.15 per cwt. from railroad to works, on the Wyoming canal it was only 25 cents per cwt. from railroad to works. (792.)

Zac T. Duvall, a veteran construction engineer who made complete surveys of the tunnel, ditches and reservoirs in 1904, says:

"I have had considerable experience with mountain construction over a long period of years. This class of construction requires much more time than it would if located on the plains and is much more expensive. The comparison is quite startling. * * * Cost of construction increases with increase of elevation in this mountain work. The working seasons shorten as the elevation increases. * * * On the Upper Rawah Ditch we could only work from July 1 to October 10 in 1904. Even during that time work was not as convenient or easy of accomplishment as similar work involving similar materials would have been on plains region, because of elevation, expense of getting material in and climatic conditions. * * * It is very difficult to keep men in the fall on work of that kind situate as high as it is. Even during summer months it is not as easy to keep them as it is on other work.

Organization of a working force on mountain work, followed by necessary abandonment and necessary reorganization the next season interposes an obstacle to rapid construction. It is almost impossible to retain men in

the late months. * * * Early winters in these high regions usually bring about a spirit of discontent." (1895-7).

Wallis A. Link, one of the originators of the Greeley-Poudre enterprise and long a resident of the vicinity of the Laramie River portion of that system, says:

"On account of elevation of country, snowfall is very heavy. It comes early in the fall and goes off late in the spring. You cannot work profitably * * * before July 1. * * * The time you would have to cease construction in the fall is very uncertain. Have seen it cease in September, and in September of 1890 or 1891, snow was so deep four horses could not haul empty wagon." (1920-1.)

"From 90 to 120 days is the limit of the working season, depending upon the snow fall in the fall of the year and the lateness of the spring. It is possible to work throughout the entire year on the plains." (2077.)

In this region the Laramie River portion of the Greeley-Poudre enterprise is in process of completion. The comparisons drawn between the obstacles and required time of construction under such conditions and in plains districts should be borne in mind when considering the more recent construction upon the Laramie Plains, particularly the Lake Hattie enterprise of The Laramie Water Company and the James Lake project, in whose behalf this suit is prosecuted.

In these plains projects, as we shall observe, none of the obstacles encountered in mountain construction at high altitudes need be overcome and construction proceeds along lines of least natural resistance.

While that part of the Greeley-Poudre system situate within the Cache la Poudre drainage is as essentially a part of the whole enterprise as is the Laramie River portion, and while work within either drainage is, in effect, work upon the whole system, and runs to the benefit of every portion thereof (Hedke, 1748), nevertheless, to enter upon a detailed discussion of the history of the Cache la Poudre portion of the system would unnecessarily encumber the argument and will be avoided except where necessary to answer the brief of plaintiff.

(b) Progress August 25, 1902, to April, 1908.

1902-4 Inclusive.

August 25, 1902, engineer Frank Beach began the *first actual surveys on the project*, as distinguished from previous

reconnaissances. These surveys started upon that unit of the system now known as the Upper Rawah Ditch. The relation of this ditch to the tunnel and entire enterprise will be considered in detail in a separate portion of the brief. These surveys continued until winter snow prevented further work. (1933, 1938-9, 2039.)

During the year 1903, as soon as natural conditions would permit, construction of roads for transportation of men, supplies and machinery to the theretofore inaccessible regions, in which the project was to be constructed, was opened and prosecuted throughout the entire working season and until the party was driven out by deep snow (1942-5, 2042-3). During the winter months of both 1902-3 the efforts of those engaged in construction of the enterprise were continuous in its behalf (1941, 1946-7, 2043-5.)

March 17, 1904, engineer R. Q. Tenney and party from Fort Collins ran the first survey of the Greeley-Poudre tunnel, and a reservoir near the west portal thereof, and made filings of the survey in the office of the State Engineer of Colorado. (1882, 1947-50, 2045-6, Defts.' Ex. 75, map.)

Early in that season a large engineering party went into the field to establish, as nearly as then possible, the final lines of the tunnel and the remainder of the system, and during that summer, after the roads were completed, excavation and open construction upon the ditch lines began with a full force of men, teams and equipment. Engineering and other construction was prosecuted with great activity from the opening of the season to the close thereof in October. (1877-97, 1947-60, 2046-51 and exhibits.)

The engineering work of 1904, after May 22nd, was in charge of Zac T. Duvall, a skilled irrigation engineer of wide experience. He was assisted by engineer R. Q. Tenney of Fort Collins and a full engineering corps. This party was engaged continuously from May 22 to October 10, 1904, and during that time the entire system was definitely surveyed and located. (1882-92).

Mr. Duvall thereafter made a filing map, showing his surveys, which was placed of record in the office of the State Engineer. (1891, Defts' Ex. 51). This filing included final surveys of the line of the Upper Rawah Ditch and Link Lake Reservoirs preliminarily surveyed by Engineer Beach in 1902 and the tunnel line surveyed by Engineer Tenney in March, 1904, as well as the units of the system completely surveyed by Mr. Duvall.

Construction in 1904, other than engineering, commenced with further road building. This continued until along in

July. (1886, 1892.) Of this road construction in 1903 and 1904, Mr. Duvall says:

> "Construction of highways in such regions is a necessary prerequisite to excavation work on ditches. *Road construction in such cases compares with the necessity of road construction in mining enterprises.*" (1886.)
>
> "These two roads were necessary before construction could begin on this system. They were necessary prior to permanent survey work done by me, although connections of the two roads were not made until later. In making my survey I had to use pack animals to complete the upper line. I made use of the roads up to the ditch line. * * * Prior to construction of these roads, supplies could be brought to this line only by pack animals from the Skyline ditch. That is not a practical method of transporting machinery, supplies and men." (1892-3.)
>
> "Prior to July 4, we had also constructed a road from the camp at the head of the Skyline ditch to the lower end of the Upper Rawah ditch. On that road we raised 1,000 feet in elevation in about a mile and a half." (1888.)

The first canal construction on the system took place prior to June 10, 1904. Mr. Duvall says of this:

> "In addition to locating the inlet ditch from the west fork to the west portal of the tunnel, I *constructed* about 500 or 600 feet of *canal* from the creek and turned water in from the west fork of the Laramie River July 10, 1904.
>
> That was the first actual excavation work on any part of the Laramie River system. Water ran through that portion of the inlet ditch which we constructed from the west fork. In constructing this portion of the ditch, I went to the outlet end of the Upper Rawah ditch and commenced permanent construction of that ditch to Rapid Creek, so that the right of way could be cleared for excavation." (1885.)

At this point let it be observed that the tunnel, later constructed and completed for the Greeley-Poudre Irrigation District, and concerning which this controversy has arisen, was upon the line selected and staked during the spring of 1904 by engineers R. Q. Tenney and Zac T. Duvall. This line is indicated on the maps, Defendants' Exhibits 51 and 75. As already noted, the first canal excavation for the entire Laramie River

system was the construction of a portion of the canal to convey water from the Laramie River to the west portal of this tunnel prior to June 10, 1904. (1885, 1898-9.)

Of the work on the Upper Rawah Ditch, being the higher collection ditch of the system, Mr. Duvall says:

> "We were able to get up to the lower end of this Upper Rawah Ditch to start our surveys July 4, 1904. We could not get up there earlier on account of the snow at the head of Fall Creek and Rapid Creek. Snow was deep and we could not do anything." (1886.)

The work prior to July 4, 1904, is described by Mr. Duvall. He says in part:

> "Crews of men had been working on the Laramie River system before I went there in 1904. A road was made from the mouth of the west fork up to the Skyline ditch, our first camp. That road was necessary as all our supplies came in that way. * * *
>
> When I arrived on Laramie River in May, 1904, the road had been constructed up to the Skyline ditch. Between June and July, 1904, I commenced work on the lower collection ditches. I commenced on the east side of the tunnel. * * * Prior to July 4 I had also constructed a road from the camp at the head of Skyline Ditch to the lower end of Upper Rawah Ditch. * * * We also constructed a log house at the head of the Skyline and Camp No. 1."

Mr. Duvall further describes the work during 1904 at considerable length. (1882-1906, 513-19 Abstract.)

He says in part:

> "Was engaged with my engineering party in engineering work on Upper Rawah Ditch during summer of 1904, from July 4 to August. Immediately after engineering, Wallis A. Link proceeded to clear right of way and blow out stumps. He had a force of men and teams. We afterwards let a contract to Walthall & Ianson to commence excavation. * * * They had the contract for excavation of 9,750 feet of work. * * * Earthwork and solid rock. * * * All rocks measuring a cubic yard and all rock in place were rated as solid rock.
>
> Mr. Link continued clearing right-of-way and as he cleared I re-located line and put in slope or cross-section stakes. Mr. Link worked rest of summer clearing right-of-way with a force of men and teams. Snow on October 10 stopped him, although he remained a short time after-

wards. I left October 10. I finished my engineering work on this ditch August 5. Ran the permanent location about seven and a half miles to McIntyre Creek. * * *

Plaintiff's Exhibit P represents line of ditch thus permanently located by me in 1904. In locating Link Lakes I used Mr. Beach's surveys.

I completed engineering work done by me on two lower collection ditches October 1, 1904. Worked on those ditches during August and September.

Plaintiff's Exhibit P represents work done in 1904. I did not assume to represent any other work done by any other engineer prior to that time. The sentence appearing in statement of claim on Plaintiff's Exhibit P: 'And work was commenced on additional ditches and pipe lines going to make up this entire claim August 6, 1904, etc.,' is the date of completion of survey. I commenced the work actually on May 22, 1904. I don't know how that date occurs in the statement. *The dates I have previously given are correct.* I have refreshed my memory by consulting a diary kept during the work.

Estimated capacity of tunnel I located and designed was 1,000 cubic feet per second. I had full engineering party with me during all this work in my department throughout year 1904. I had the assistance of engineer R. Q. Tenney for a short time and Mr. Norvelle was instrument man and assisted me in mapping.

Activities in construction of ditch line were going on during all the time I was there. Both surveying and actual excavation. The first work was clearing right-of-way before we commenced final location. * * *

Headquarters for work done on Laramie River that year was at Lanning's. Our supplies were brought in by teams to Lanning's place and other teams would * * * bring them up onto the line of work. That was a freight station. An employee was in charge. * * * It is on floor of Laramie Valley.

We had light snow storms pretty nearly all summer in 1904. * * * Snow drifts were lying on ground on line of upper ditch up to August 5. This canal is located in regions where the snow falls the year around. * * * Upper Rawah Ditch is in neighborhood of 1,800 feet higher than west portal of tunnel. * * * (1888-95).

He further says:

"In 1904 and 1905 I ran three tunnel lines; one indicated by tunnel line appearing on Plaintiff's Exhibit P,

One coming out of Laramie River a little west of portal of that tunnel and discharging into Poudre at the same point, and one coming out of Laramie River about a mile and a half north of first portal named and also discharging waters into the Poudre River at the same point.

The one found on Plaintiff's Exhibit P was selected. It is the one on which the present tunnel is located. (1899) * * *

Mr. Link did a small amount of work at the outlet end of the Upper Rawah Ditch and on August 6 had charge of the work of excavating on the north side of Rapid Creek. (1902.)

When we finished the work in 1904 we had a road along the line of the Upper Rawah Ditch clear to the head of the ditch at McIntyre Creek. Work was done to Station 67 from lower end of the ditch about 6,700 feet, although it was not all completed over this portion. The contractor was given credit in two estimates for 8,538 yards excavation." (1903.)

Wallis A. Link and A. I. Akin were the original projectors of the Greeley-Poudre system and the earlier work on the system was under their direction and supervision. Mr. Link, after describing at considerable length the work done in 1902 and 1903 (1932-47), of the work of 1904 says, in part, as follows:

"Left Fort Collins March 9 and arrived there March 12, 1904. We concluded we had better make survey of tunnel so I took team and number of men with R. Q. Tenney, surveyor (1948). We were engaged five or six days surveying. There was a great deal of snow on tops of mountains. It averaged two feet on Laramie Valley from what we call Middle Mountain to tunnel site.

Site surveyed by Tenney is practically same place previously selected by me (1948).

After return of survey party to Fort Collins Mr. Tenney made up notes of his survey and Mr. Hedke was engaged with him figuring out distances and other like work. We were active all along the line in raising money until about April first. From about that date it was decided I had better go back again and take men and do work on reservoir site, which we called East Fork Reservoir and which was intended as equalizing reservoir for tunnel. * * * Mr. Tenney ran fly line from East Fork Reservoir to tunnel * * * March 15, about same time we surveyed line over tunnel. * * * (1949).

I knew Mr. Duvall to be a practical man for mountain ditch construction. * * * His services were secured. * * * I took crew of men up to the territory and left them there and came back and got Mr. Duvall and another man and we went to work surveying and making final survey of tunnel. Men had been working on road up west fork of Laramie River all time I was gone. (1951.)

Survey was carried on throughout entire summer of 1904 during which time the entire mountain system was surveyed.

All surveys of all ditches now in course of construction were completed during summer of 1904. We had to work here and there as the snow would permit.

The line of the tunnel selected by Mr. Duvall was about the same line as selected by Mr. Tenney and myself. The lines might vary a few feet from one another. Other lines were run to ascertain which was best line. (1952.)

During 1904 * * * Considerable money was raised and expended * * * both in surveying and construction. *$13,000 to $14,000 was expended* in surveying and construction on the Link Lake properties during that summer.

The Upper Rawah Ditch was also surveyed * * * final line was run and most of its cross-sections. The line finally selected was practically the same line as selected by Beach in 1902. The only difference was the difference of opinions of the two engineers in getting around some obstacle. It was practically the same line described by me before first survey in my first conversation with Mr. Akin. (1954.)

There was a great deal of construction work done in 1904 outside of surveying. All necessary clearing was done from west fork of Laramie River for ditch across to east fork of Laramie River and to tunnel. Considerable of ditch line was plowed and some of it finished so as to turn water into it. The ditch required considerable clearing of timber at this point. Work was done on floor of Laramie Valley nearly level with west portal of tunnel. * * * It was so constructed that water flowing through the lower west side collection ditch as well as from the Upper Rawah Ditch, would be carried across and into the tunnel. First clearing on any part of the project was on East Fork Reservoir and next clearing was on ditch line from west fork to the tunnel. * * * (1954.)

Established construction camps in 1904. We excavated about 6,000 feet of canal on Upper Link Lake

Ditch as we then termed it. * * * This is the same ditch now known as Upper Rawah Ditch. We also cleared about three and one half miles of timber. * * * Necessary to construct road up west fork of Laramie River and over the mountain to meet the south end of the road coming from the north to Grassy Pass in order to construct this upper ditch line. * * * Country up west fork and mountain side is very hard place to build roads. * * * (1956.)

Camp was established and excavation by force of men and teams was commenced on Upper Rawah Ditch about middle of July, 1904. I was in charge of outfit doing work that season. Work was continued until along in October when snow stopped us. Work was continued throughout all weather permitting excavation. Snow got so deep that we could not work. * * * I stayed there longer with five or six men and continued clearing. * * * We did considerable of this work on this ditch with teams. * * * (1957.)

Supplies were hauled in with freight teams hired to transport it to Lanning's cabin. * * * From the cabin I had a four horse team that hauled supplies from the cabin up the mountain to the work. Did not have freighters for provisions all the way up because * * * their horses were not used to that character of work.

In 1904 in prosecuting excavation and construction work on Upper Rawah Ditch *we had 35 men in our camp* and *contractor* Ianson had *18 or 20 men all the time.* * * * (1958.) *My gang of 35 men* were employed all along the line from west fork of Laramie River to Grassy Pass. The work was prosecuted by this force of men and equipment that I have mentioned throughout the entire period of construction in 1904. The work ceased only when the snow got so we could not handle the timber to advantage." (1959.)

The work by Link and Akin and associates during 1902, 1903 and 1904 is well illustrated by Defendants' Exhibits 52 to 73 inclusive, a series of photographs taken at various times during those three years.

The Exhibits 52 to 55 inclusive show the 1902 party at the time of the early preliminary survey during that year. (1965-7.)

Exhibits 55 to 64 inclusive show the general character of the timber in the mountain country in which the collection ditches of the system are constructed and through which no existing roads or means of travel existed prior to the roads constructed by Link and Akin and associates in 1903 and 1904. (1968-71.)

Exhibit 65 is a photograph showing the first survey of the Greeley-Poudre tunnel March 12, 1904, by R. Q. Tenney. (1972.)

Defendants' Exhibits 66 to 72 inclusive indicate, to a slight degree, the construction taking place on the Upper Rawah Ditch during that year. (1975.)

Mr. Link further says:

> "In 1904 about fourteen thousand dollars was expended on construction work and clearing, not including surveys." (1988.)

With reference to filing No. 1722, office of State Engineer of Colorado, which is the same as Defendants' Exhibit 51, witness Link says:

> "That is the same filing identified by Mr. Duvall and pertaining to surveys made by him. This map does not pretend to show anything else than the surveys made by Mr. Duvall."

With reference to Defendants' Exhibit 75:

> "Filing No. 1417, office of the State Engineer of Colorado, pertained only to Mr. Tenney's survey and especially the tunnel line surveyed by Mr. Tenney during 1904. The map merely attempts to show the lines run by Mr. Tenney." (2029.)

Mr. A. I. Akin, one of the original projectors, after describing the activities of 1902, including the surveys made by Engineer Frank Beach and party commencing August 25, 1902, and terminated by snow (Defendants' Exhibit 74, map by Mr. Beach), (2039-42), and after describing the activities of 1903 consisting largely of necessary road construction and financiering (2043-5), refers to the work of 1904 in part as follows:

> "May, 1904, Mr. Duvall went to work. Have heard Mr. Duvall's testimony. He covered the situation very fully. I corroborate what he said in that regard. *In 1904 construction work was carried on on Upper Rawah Ditch* * * * *from west fork to east fork* of Laramie River and to *tunnel.* * * * Have heard testimony of Mr. Duvall and Mr. Link concerning construction work going on in 1904. They stated the facts in that regard.
>
> About *$20,000* was placed in this enterprise in the construction of the *work in 1904.* No construction work was going on that year on the plains distribution end of the system. * * * (2046-7.) August, 1904, Mr. Link started excavation on Upper Rawah Ditch at lower

end. * * * Ianson & Walthall started work on August 10. I have photographs of work completed during season of 1904 on Upper Rawah Ditch.

Defendants' Exhibit 76 is picture taken about 1,000 feet above lower end of Upper Rawah Ditch where it drops into west fork of Laramie River around the rock point. * * * It shows conditions as they existed that year. I have photographs which, though taken at later date, show conditions at close of work in 1904.

Defendants' Exhibit 77 is photograph of lower end of ditch where it drops into west fork of Laramie River and where Link started to cut in 1904, showing water coming out of end of ditch. Shows conditions as they existed in 1904. (2048.)

Defendants' Exhibit 76 is ditch line where Ianson & Walthall did their work. * * * Shows ditch lines and how it was constructed.

Was with surveying party of Zac T. Duvall during most of season of 1904. Defendants' Exhibit 51, known as Duvall's map * * * shows Upper Rawah Ditch * * * East Side and West Side ditches * * * and tunnel line. Mr. Duvall did no engineering work on other units or parts of this system than those shown on Exhibit 51. Only difference between Duvall's survey and present West Side Collection Ditch is that it is carried on side of mountain to tunnel instead of crossing river with pipe line.

Diversion system portrayed on three maps, Exhibits 51 (Duvall map), 74 (Beach map) and 75 (Tenney map) is practically the same system first conceived by Mr. Link and me in our expedition in 1902. Beach survey was preliminary. Tenney survey was also preliminary. Duvall survey was definite location. (2049-50.)

Mr. Duvall was engineer in charge of work of excavation as well as definite location of lines. * * * Harry L. Monroe came into association of individuals interested in project in summer of 1904, just before we started work on Upper Rawah Ditch. He advanced money in connection with starting work. Later severed his connection with firm." (2051.)

"As I recall the amount paid Ianson & Walthall for work on the Upper Rawah Ditch in 1904 was between $3,700 and $3,800, this not including the work that Mr. Link performed. These contractors had a contract for 2½ miles on the lower end of the Upper Rawah Ditch, but they did not do all the work. They distributed the work over the whole distance and we completed the work with Japs and Greeks in 1907. Mr. Link worked a gang

of men in 1904 clearing the right-of-way through 2½ or 3 miles of timber and excavating along the ditch line both before and after the contractors did their work. The gang he worked, of about 30 men, was changed back and forth from clearing to excavating from August to October, but I cannot say how much work was done on excavation by that gang. Sometimes we had as many as 50 men, and I believe never less than 25, there being on an average about 30 or 35 working for * * * two months and a half. Part of the time he had four teams upon this work." (2071.)

Mr. Akin, after describing at considerable length the work and expenditure from the beginning down to 1908, says:

> *"Our work from 1904 to and including 1908 was open and notorious and open to the observation of people both in Colorado and Wyoming. People in Laramie River valley knew of the work 1904 to 1908.* We bought supplies, butter, eggs and other like commodities up and down the river. We were freighting from Fort Collins all the time. *People* were coming and going *from Laramie City* at the time we were surveying and we had parties *visiting at the camps there off and on and watching the work.* We bought all our meat supplies on Laramie River." (2064.)

Charles R. Hedke, subsequently construction engineer on the entire Greeley-Poudre project, thus speaks of the 1904 work:

> "My first acquaintance with the Greeley-Poudre project of the Laramie valley was in 1904, when there was under consideration the diversion of water from the Laramie River to the Cache la Poudre River by means of a tunnel. The matter was brought to my attention and discussed. Persons working on the project consulted me at that time. * * * My work in 1905 consisted of a general analysis and special detailed survey as a means of applying the waters of the Laramie River to the lands in the Cache la Poudre valley, and also work in connection with the settlements of the contractors and owners of the Laramie River system, upon work done on the Laramie River system in the year 1904, upon the unit of the Greeley-Poudre system now called the Upper Rawah Ditch * * * situated on the west side of the Laramie Valley at an altitude of about 10,500 feet. Work had been done the year previous and the contractors were forced to go out of the country on

account of the snow, and final and complete estimates were not made that year but were completed and made by me in 1905. This required me to go over that work already done in great detail for purpose of estimate. The work performed at that date was of a very good character * * * of mountain ditch construction. Between 4,500 and 5,000 feet of mountain ditch construction had been completed at that time. There was considerable solid rock and loose rock material. * * *

There had been actual construction done before I became associated with the project. * * * Roads were built to the works, clearing had been done to a great extent, necessary preliminary work had been performed. The 1904 work had progressed under the direct supervision of Mr. Zac T. Duvall, an engineer of Denver, Colorado. In 1904 some work had been done by Mr. R. Q. Tenney, of Fort Collins, prior to the time that Mr. Duvall was employed.

In 1905 I found a road constructed from the valley of the Laramie proper, up the west fork to the work outlined and to Rawah Creek, which is a very rough section of the country, and involves a difference in elevation of about 2,000 feet in two or three miles. This was a very heavy piece of road work. There was also a road constructed to the state road to the north of this property. This road was constructed * * * in a southerly direction to the upper end of the Rawah system in the neighborhood of McIntyre Creek and Rawah diversions. It was about seven miles long. The principal obstacle that had been encountered in the construction of that highway was the heavy timber, both green and fallen. Several sections of that road were constructed through a burned timber district that it was required to clear and remove the boulders from the surface, thereby usually permitting a pretty good road to be constructed.

These two roads penetrated a country which in fact had never had even trails previously. It was a country ranging in elevation from 8,500 to 11,000 feet and even higher elevations. It was in the region of perpetual snow and was very wet during the summer time and required many structures of corduroy to make the roads passable over swampy places. *The construction of these roads was an absolute necessity before beginning actual ditch construction,* as there was no other means of getting into the country. It would be impracticable to pack materials, machinery, tools and supplies that would be necessary for the work contemplated in that region.

The region thus penetrated by these roads is one of short working seasons, lasting from July 1st to October 1st out of the year. Sometimes the season is even shorter than that, depending on the snowfall and the character of the spring, which causes heavy thaws and a greater run-off. From October 1st snow storms are frequent and snow gets very deep and it is impracticable and impossible to do any such work. The canal is very close to timber line. The region above the line of this canal has peaks above an elevation of 13,000 feet.

I found the first work upon this system and in this inaccessible region performed. There had also been considerable surveying, clearing and other work done on the system preceding that time.

In 1905 I found then surveyed and in process of construction the system of works afterwards constructed. *It was substantially the system as it exists today*, that is, the main features are the same. The details had been worked out in somewhat different lines and some changes of a slight character have been made, but in the main the system is the same.

I found the tunnel line located and surveyed.

The final line of the tunnel was placed on exactly the same line that I found surveyed in 1905, after all possible other considerations had later been taken into account. That was the line of the Duvall and Tenney surveys. The collection ditches of the present system were substantially outlined at that time, minor changes, due mostly to the size and character of the enterprise and the existing conditions, and also brought about by a better class of construction than originally contemplated, had been made.

The system as a whole is the same for all practical purposes. As an example of the slight departures made I will state that the system of collection ditches on the west side was designed to carry water on that slope from the drainage area, and on account of the physical obstacles it was then proposed to take water across the valley in a pipe line. These difficulties were great cliffs of rock. * * * I discarded the idea of the siphon line and substituted tunnels on the ditch. * * * These changes made no difference on diversion of water and the object was just the same." (1743-8.)

The testimony of witnesses Zac T. Duvall (1874-1906), Wallis A. Link (1907-2038) and A. L. Akin (2038-78) gives a complete history of the enterprise for the years 1902, 1903 and 1904. Their testimony is not contradicted. The first two of

these witnesses had severed their interests with the enterprise long prior to this suit.

It will be observed that commencing with August 25, 1902, work was continuous throughout the remainder of that year and the open seasons of 1903 and 1904. Also that this work was open and notorious; that the people all up and down the Laramie Valley were fully aware of what was going on; that wagon freighters were passing to and from the far distant railroad stations hauling men, supplies and machinery; that visitors from Laramie, Wyoming, were frequently at the construction camps and stood by watching the work; and that in the construction large crews of men were engaged in large part in rock excavation requiring the use of powerful explosives, the reports of which could be heard for miles.

That all this was well known to the citizens of Wyoming is not denied or disputed. Here was not a mere fiction,—a mere reconnaissance coupled with a possibility that some succeeding generation might construct an enterprise,—but on the contrary, a direct, positive, open and notorious demonstration. Continuity of surveys was coupled with open construction involving expenditure of large sums of money, and all was directed toward the one common objective of conveying the water through the tunnel from the Laramie into the Cache la Poudre. The first excavation upon the ditch leading from the Laramie River to the west portal of this tunnel was a physical demonstration and proof of the intent of the parties. It was upon to the observation and access of all those who visited the region and became at once a matter of public knowledge.

Subsequent to 1904, work continued with equal diligence upon the project as a whole. The works necessary to divert, carry and distribute water to the lands in the Cache la Poudre valley are as necessary as the Laramie River diversion system. Hence activities alternated more or less from the mountain or Laramie River portion of the system to the plains or Cache la Poudre portion of the system from year to year thereafter.

Mr. Hedke says:

> "It was on the same general project, in fact, it was the lower end of the same project, the distribution end. *Diversion without distribution would be of absolutely no avail.* The plains work was only a portion of the same project, one is as essential as the other." (1749.)

He further says:

> *"Work was always going on somewhere in connection with the project, it never ceased. It was continuous."* (1749.)

1905-6 inclusive.

A knowledge of the work upon the system in the years 1905 and 1906 is best obtained by reading in full the testimony of the witnesses Link and Akin, already referred to, and also that of engineer Charles R. Hedke (1723-1873), who became acquainted with the project while acting as consulting engineer in March, 1904, at the time Mr. Tenney ran the first survey of the Greeley-Poudre tunnel and was actively engaged as engineer on the project in the early part of 1905. The years 1905 and 1906 were largely devoted to extensive surveys and definite location of works for the distribution and application of the water of the system to lands in the Cache la Poudre valley. (1748-9, 1751-2, 1961-3, 2051.) Employees were also on the Laramie River working upon that portion of the project. (1753, 1964.) In 1906 Wallis A. Link disposed of his interest in the project. (1965.) During these years surveys were also made to verify the wisdom of building the long Greeley-Poudre tunnel. (1753, 1760-3.)

The testimony of Charles R. Hedke with relation to these two years is quite complete and corroborated by the other two witnesses:

> "They had a supply of water and the general plan of working out that problem of supply and a general, natural and inevitable place to put that water. The problem was the connecting up of the two ends of an irrigation system, viz., supply and use. In this particular instance, in a highly developed country with many previous enterprises, it resulted in the problem of gathering many enterprises having the same general end into one large enterprise.
>
> The area possible to irrigate, when this enterprise was originated, was much larger than that now embraced. There is much more available land than is included within the Greeley-Poudre Irrigation District. It was natural to investigate and get all the water possible, including rights initiated, on the Cache la Poudre and those initiated and carried out on the Laramie River and all their constructions and extensions." (1818.)
>
> "The work I did in 1905 * * * was the investigation of the distribution end of the system and of the plans and examination of the work performed in 1904 in the mountains, which I went over in order to make a settlement of the contract for that work * * * which was on the Upper Rawah Ditch under the direction of Mr. Duvall. (1792.)
>
> My work of 1905 consisted of a general analysis and special detailed surveys as a means of applying the water

from the Laramie River to lands in the Cache la Poudre valley. (1743.)

In 1905 I found then surveyed and in process of construction the system of works afterwards constructed. It was substantially the system as it exists today, that is, the main features are the same. (1746.) During 1905 the company was preparing itself for the expensive financing necessary to develop this project and such work was performed as could be done with the means at hand. (1749.) The major portion of my time in 1905 was spent on this enterprise on the plains. The relation of the plains work to the Laramie River work was that of working out the details connected with the work of distribution and application of that water to lands in the Poudre Valley." (1748.)

"In 1905 and 1906, we considered almost every piece of property on Cache la Poudre river in connection with this system, and surveys were made in these computations. Lines of distribution, water supplies, lands to be irrigated, and how the system could be used in connection with other systems for distribution were considered; necessary surveys from reservoirs and all lands, several of which went as far as the Crow Creek county east of the Union Pacific Railroad. Other work was done in connection with the system at the upper end taking into consideration group of reservoirs then belonging to the North Poudre Irrigation Company and its relation to this system.

This involved surveys for the different reservoirs and computations were made as to capacity and cost of incorporating them under the general system." (1751.)

He then describes the absorption during that year of the Eastman Canal and other systems into the distribution portion of the Greeley-Poudre system, and continues:

"These are examples of work which was generally going on during that time. The works were numerous and entailed a very careful consideration of a large number of the systems of Cache la Poudre valley. Expenditure of money on the system was constant during years 1905 and 1906, principally along line I have mentioned."

"In connection with development of an enterprise as large as the Greeley-Poudre, involving large expenditures of money, it is always necessary to investigate every possible means of accomplishing the same general end by the cheapest and best means." (1752-3.)

"In 1905 and 1906 diversion of this water from Laramie River and its effect upon the stream and interests

along river were investigated by me. Data was collected and brought into shape, hydrographs were made of the flow and computations made of supply available at the various points of diversion for the best design of works and other information of general value obtained. This work involved expenditure of money, largely in office force. It continued entire time we were employed on river." (1758.)

"In 1905 and 1906 surveys were made in connection with general project to verify wisdom of building tunnel. Investigations of every possible means of diverting water were carried on. Laramie River Reservoir was surveyed in connection with survey for purposes of ascertaining feasibility of diversion of water from Laramie River drainage through the reservoir and an outlet canal from it in place of tunnel and collecting ditches. * * *

The result of this survey in 1906 was that it was impracticable to build this canal." (1760-1.)

"Surveys of Laramie Reservoir were completed, but it was separate and apart from the system commonly called the Greeley-Poudre system. It was surveyed and mapped as a subsequent and junior enterprise. (1767.) * * * during the summer of 1905 I did considerable work in the way of going over various properties and ascertaining their relations to each other and to the new project, and making some detailed surveys, one being of Reservoirs 5, 6, 7 and 9, and determining the area of lands the outlet from those reservoirs and from Cobb Lake Reservoir would cover." (1791.)

"In addition to the construction work which I have mentioned as being performed since 1904, the engineering work in the field with oftentimes as many as four parties, the office investigations and classification of data, the financial efforts of Mr. Hibbard and his associates, were going on continuously and practically all the time." (1817.)

"The two major considerations in connection with this project were the water supply and the expense of conducting the water to the land. It was understood from the first that at least 125,000 acre feet must be delivered at the land, and reservoir facilities for about 100,000 acre feet were provided in the plans." (1847.)

Let it here be noted that the Greeley-Poudre project involves reclamation of area almost half as extensive as the entire

present reclaimed area within that drainage, from all ditches, canals and reservoirs. These have been in process of construction through more than forty years.

Wallis A. Link stated:

"It was recognized by me and by my associates that it would be necessary to locate ditches and works upon plains of Poudre Valley as well as to construct ditches in mountains.

Poudre Valley Ditch had been constructed out of mouth of Poudre Canon in 1902. I have viewed lands that might be served from extension of this canal. I was along at time survey was made of such extension by Mr. Charles R. Hedke, engineer. * * *

In 1905 expenditure of both money and time was made in investigation of territory in Cache la Poudre Valley in which to make use and application of water to be obtained by means of the Laramie River system. I was engaged in this work as well as in work in the mountains during that year. Was in mountains during all fore part of season and later in summer we came down and ran survey from Reservoirs 5 and 6 of the North Poudre system down to Union Pacific Railroad and beyond. The Reservoirs 5 and 6 are capable of being filled from the Poudre Valley Canal.

Poudre Valley Canal is upper end of ditch for carriage of water from Poudre River in Cache la Poudre Valley to the Greeley-Poudre Irrigation District. Mr. Hedke made two surveys from Reservoirs 5 and 6 for an extension of Poudre Valley Ditch to Union Pacific Railroad and beyond. Generally speaking, this line of survey is indicated by the ditch line leading out towards McGrew Reservoir and shown on the map, Exhibit 1, attached to answer of corporate defendants. (1961-2.)

* * * I heard testimony of witness Charles R. Hedke, who just preceded me. The surveys as he described them for the year 1905 works are correct. He was the engineer who did the surveying. (1963.) * * *

In 1905 I was in mountains from about April 1 until sometime in August or latter part of July. Excavation work was not going on in mountains during that summer. * * * I was engaged all summer in caring for the ditches and other work." (1964.)

"In 1904 the principal place of business of those interested in this project was in Fort Collins. Mr. Hibbard was financial promoter of proposition. He resided

all the time in Fort Collins after entering into project. He engaged in no other business than the projection of this system and was continually employed in promoting it. He made several trips east, met people, financial firms, and bond brokers, to promote the proposition and raise money.

The co-partnership had engineers in field the most of the time from 1904 on." (1963.)

Witness A. I. Akin says:

"In 1905 and 1906 efforts of myself and associates were directed principally toward the distribution end of the system, on Poudre River side. To taking water through Poudre Valley Ditch out to plains east of Nunn and Pierce. Charles R. Hedke was engineer for association of individuals during that period. I have heard his testimony given in this case. He described correctly the work done by him or under his supervision during those years." (2051.)

"A contract to run water through the Poudre Valley Canal was the result of the negotiations carried on with The Poudre Valley Reservoir Company during years 1905 and 1906. Water to be carried for use on land from ditch extending east from end of present Poudre Valley Canal.

During 1905 and 1906 the association of individuals and The Laramie Reservoirs and Irrigation Company expended considerable money to further the enterprise.

Up to October, 1906, $31,736.90 had been expended by the association of individuals and the company on this enterprise. We had also expended $4,998 in purchase of property on Laramie River.

At the beginning of work in 1907 (March 1), my associates and I had expended on the system, outside of purchase of properties on Laramie River, $34,045.01. In both ranches and work we had expended $46,079.32." (2053.)

The initial survey was commenced August 25, 1902, and outside of the work performed by Messrs. Link and Akin that fall, some $350 was expended in making the Beach survey. (2042.) The necessary road work of 1903 has already been described. During 1904 about $20,000 was placed in the enterprise. (2047.) Practically all of this work for these was on the Laramie River portion of the system, so that during 1905 and 1906 it was essential that plans for the distribution end be completed and before the beginning of work in 1907, $46,079.32

had been expended upon the project, and upwards of $20,000 during 1905 and 1906.

1907—April, 1908.

During the years 1902-6, the title to the property had vested, first, in Wallace A. Link and A. I. Akin; subsequently, in the early spring of 1904, Myron Akin and Wellington Hibbard became interested, the latter continuing his services in connection with the enterprise until killed while in the performance of his duties on March 25, 1910. (2045.)

September 19, 1906, The Laramie Reservoirs and Irrigation Company was formed and succeeded to the previous association of individuals. (2051.)

March 19, 1907, the defendant, The Laramie-Poudre Reservoirs and Irrigation Company, was organized and succeeded to all the rights, titles and property theretofore owned by The Laramie Reservoirs and Irrigation Company. (2052.)

Thus we find the defendant corporation in full charge of affairs before the opening of work in 1907.

The winter of 1907-8, prior to the opening of work in the spring months in the latter year, will be treated along with the year 1907.

With the opening of the working season of 1907 (not 1909 as erroneously suggested in plaintiff's brief), *general construction proceeded from the furthermost canal of the system, the Upper Rawah Ditch on the Laramie River, clear through to the principal distribution canal now known as the Greeley-Poudre Canal,* being an extension of the Poudre Valley Canal, eastward along the north side of the Greeley-Poudre Irrigation District. The matured plans, thoroughly worked out at great expense under the supervision of Engineer Charles R. Hedke, for distribution as well as diversion, had been adopted by the defendant corporation and construction proceeded upon the entire system. (1768-71, 2054-68.)

Crews of men with full equipment, including about fifty white men, a pick and shovel crew of about one hundred Japanese, and a heavy rock excavation crew of about fifty Greeks were at work on the Upper Rawah Ditch from the opening of the season (July 1) to the close (October 1), during 1907 (2054-8, 2060), and numerous wagon freighters were hauling supplies, men and machinery to and from Fort Collins, Laramie and southern Wyoming points.

The character of this work is well illustrated by photographs taken by A. I. Akin and introduced as exhibits:

Exhibit 79, photograph of Upper Rawah Ditch at point where snow had been shoveled out in early part of July, 1907.

Exhibit 80, showing gang of Greeks shoveling snow of road in July, 1907.

Exhibits 81, 82 and 83, photographs of gang of about one hundred Japanese, foreman, engineers and portions of work in process of construction.

Exhibit 84, photograph showing gang of Greeks working at heavy rock work on the Upper Rawah Canal.

The Upper Rawah Ditch was completed from its point of discharge into the west fork to a point in the neighborhood of Camp Lake (one of the Link Lake Reservoirs) and clearing and surface work were done to the latter point. The work continued until prevented by snow. (1757, 2054.)

Evidence of work on this portion of the system during 1907 shows:

Charles R. Hedke:

> "In beginning of season 1907 labor conditions were favorable, men were hard to get in a region of that kind, work was plentiful and after considerable negotiation along those lines finally some foreign labor was used in construction." (1754.)
>
> "In 1907 upper unit of Laramie River portion of works known as Upper Rawah unit was extended and surveys were made in connection with the canals and works of that entire unit. The work covering the largest expense was in connection with the Upper Rawah Ditch, upon which considerable work was done that season." (1754.)
>
> "In 1907 there was completed on Upper Rawah Ditch the section of canal from its discharge into the west fork, * * * to a point in the neighborhood of Camp Lake. Clearing and surface work was done as far as Camp Lake. Several hundred feet of excavation was opened up at the upper part of this clearing, but snow stopped work and parties were obliged to cease just as snow found them so that certain portions of upper line were not entirely completed." (1757.)
>
> "The work performed on the Upper Rawah Ditch during 1907 was a part of the general work going on over the entire system. *From $40,000 to $50,000 was expended in 1907 on the Upper Rawah Ditch.*" (1795.)

A. I. Akin:

> "In 1907 in mountain division we let contract * * * for use of his teams and equipment * * * also made contract with some Greeks * * * to do part of work on Upper Rawah Ditch * * * and contract with Hokosana, a Jap, to do part of the hand or pick and shovel work on that ditch where we could not use teams. We proceeded to excavation work along line of these contracts.

Work was carried on during season of 1907 from July 1 to October 1, when snow storms started in and we had to come out. I have photographs representing conditions along line of Upper Rawah or Link Lake Ditch at beginning of work in 1907." (2053-4.) (Ex. 79-84.)

"We got excavation along line of Upper Rawah Ditch entirely completed to point above Rapid Creek. Then there are portions above Rapid Creek and towards Camp Lake where the work is finished. Right of way is cleared of timber to Camp Lake. Capacity of ditch as completed from Rapid Creek to West Fork of Laramie River is 224 cubic feet of water per second of time." (2058.)

"In 1907 we paid the men who were working on the Upper Rawah Ditch every 15 days in money. * * * I carried the money * * * from Fort Collins to the Upper Rawah Ditch for payment of the Greeks." (2065.)

Work on a larger scale was proceeding on the distribution portion of the system in the Cache la Poudre Valley during the Summer and Fall of 1907 and the Winter of 1907-8. This was principally upon the main canal of the system, beginning at the lower end of the then existing Poudre Valley Canal and extending easterly to Crow Creek via the McGrew Reservoir (see Exhibit 1 attached to corporate defendants' answer). This work was in charge of Engineer Charles R. Hedke and was performed by the defendant, The Laramie-Poudre Reservoirs and Irrigation Company.

Mr. Hedke says, in part:

"There was other work going on at that time on plains division. That work opened up about April 1, 1907. Prior to April, 1907, plains work was generally outlined and a definite location with cross-sections marked. Purchase of rights of way was commenced in 1907 and actual excavation was commenced immediately after. * * *

In the Spring of 1907 active operations on excavation began on plains, rights of way were purchased and arrangements were made with various enterprises which were to be linked up with this system. *Construction work was done on not less than 30 to 35 miles* at various points. * * * Condemnation proceedings were commenced and construction work had to proceed at intervals along line, thus making continuous ditch impossible.

Work was carried on through entire year of 1907. A large amount was done, principally in the vicinity of

Wellington, Colorado, and a little to east. All to east and along the line of the extension of the Poudre Valley Canal. That is same line of canal commonly known as Greeley-Poudre Canal. It is indicated on Exhibit 1 by red line along north border of colored area and to west of such area indicated by red line. It is the upper canal of the Greeley-Poudre system.

General construction went on over the entire system of which I have spoken. Work on plains was that of ordinary earth work construction of the vicinity and the outfits usually consisted of men and teams with fresnos and slips, and at that time we had an elevating grader and steam engines for pulling. Had two of these outfits on this line of canal. There were six or seven team outfits averaging 15 to 20 teams per outfit. * * * There was some rock excavation requiring use of powder and materials were taken out with carts and stone-boats.

This work continued entire year of 1907 and into year 1908. It continued after we had ceased labor on Upper Rawah Ditch in Fall of 1907. The force employed on the Upper Rawah Ditch on Laramie River division, when compelled to come out on account of weather conditions, continued to work on the plains division.

In the Fall of 1907 financial panic interfered to some degree with finances of company. To overcome the situation there was issued by Company obligations called script, which obligated Company to pay same out of first moneys derived from sale of bonds of Company in future. About $50,000 of such indebtedness was incurred. It was all used in keeping up work on system after October, 1907. Its full value was received in work upon system after panic. * * *

In 1907 and 1908 $129,572.00 was expended on actual construction on the system, in addition to overhead expenses. That was all expended in construction of the Greeley-Poudre system. * * * *About $25,000 was expended in 1908 on the work.*" (1768-71.)

Same witness, on cross-examination, said:

"In that year there was considerable work in the Poudre Valley, in the extension of the Poudre Valley Ditch. The Laramie-Poudre Reservoirs and Irrigation Company having acquired the carrying interest in the Poudre Valley Ditch, although not a stock interest in the Company, built several sections of a proposed extension of that ditch to the town of Nunn.

I would say that the amount expended on this exten-

sion work was about $70,000, this covering only construction work. Several separate sections of the proposed extension were completed, and some sections were not worked upon on account of the lack of right-of-way." (1796-7.)

"In the Poudre Valley the work of 1907 continued through the winter and into the spring of 1908, and in that year some work was done on the Black Hollow Cut on the Greeley-Poudre Canal. * * * All of the work that was done was on the extension of the Poudre Valley Canal." (1799.)

A. I. Akin says:

"In summer of 1907 final location of Laramie-Poudre Canal to Crow Creek was finished. While we were working in the mountains with the Japs, the Greeks, and also the gang of white men, Mr. Hibbard and Mr. Siegler, acting for the Company, purchased two * * * engines and graders and started those at work west of Wellington and east of the end of the Poudre Valley Ditch. They worked those engines until October on that piece of work * * *. They took the Greek crew which we had in the mountains, when they came down, and used them till after Christmas putting in the siphon across Box Elder Creek * * *. This was crew of 50 men. (2059.)

* * * In 1907, Ianson, after coming out from the mountain work, took charge of the engine crews with grading teams * * * and worked there until Christmas time. * * * Coal Bank Draw is 12 miles east of Fort Collins.

During 1907 and 1908 other construction contractors were excavating earth along line of Greeley-Poudre Canal. Mr. Lemonds of Nunn, Colorado, had a crew working west of that place, and about 5 miles due west of Pierce. In 1907 Mr. Harry Knowlton finally took contract to build the whole ditch system out to McGrew Reservoir, and in that contract he took over the engines and graders and all camp equipment that the Company owned, and took charge of the work and kept going part of the summer of 1908. * * *

There may have been other contractors in 1907 and 1908 other than those I have mentioned * * *

These contractors I have mentioned were strung out along the line between the lower end of the Poudre Valley Canal and the McGrew Reservoir during 1907 and 1908. This new ditch constitutes an extension of the Poudre Valley Canal. * * *

I should judge about $250,000 was expended in excavation work, enlarging equipment and supervision in 1907. * * *

In 1907 the financial panic temporarily tied everything up. As the result of the panic we had to issue script owing to the fact we were running out of money. We had made arrangements for more money. The panic caused these parties to fail to keep their contract and furnish us money. * * * We paid the men half in cash and the balance in script. This we did until February, 1908." (2065.)

It is apparent that an enormous amount of work was done upon the enterprise during 1907 and the winter of 1907-8. $129,572 was expended in actual construction on the system, in addition to overhead expenses. About $250,000 was expended in construction, rights-of-way, equipment, engineering and all overhead expenses during this time. Crews of men were actively engaged from the mountain peaks on the Laramie River to McGrew Reservoir in the Cache la Poudre drainage. In the latter division teams and contractors were strung along some 30 to 35 miles of canal and great steam drag-lines were at work on part of the canal. With $46,079.32 expended upon the system prior to 1907, a total of $296,079.32 had been spent prior to the Spring of 1908, not including purchases of additional water-rights, properties, etc.

The Lake Hattie, James Lake and other minor projects on the Laramie Plains in Wyoming were initiated in the Spring of 1908. The initial surveys on the James Lake project were commenced March 22, 1908. (638.) Those on the Lake Hattie system were commenced April 16, 1908. (650.) These surveys continued with slight interruptions for a little over a year. The final location of the canals was started about May 1, 1909. Actual construction was started on the Lake James project July 17, 1909.

It thus appears that during less than six years immediately prior to the initiation of and construction upon the Wyoming projects, there had been expended on the Greeley-Poudre project upwards of $296,079.32 (not including purchase of properties, etc.), between August 25, 1902, and March, 1908. During that time definite and final surveys had been made of the entire Greeley-Poudre system and open construction had proceeded on mountain roads and canals during the working seasons. Canal construction proceeded upon the Plains of the Cache la Poudre where all travel from Wyoming to Denver passed in plain view. All of the operations upon the entire Greeley-Poudre system during all of these years was most open and notorious and well known to the citizens of both states.

No pretense is made by Wyoming that the Lake James project diverting waters from the Little Laramie River and to that extent depleting the general supply of the stream, had its inception before the dates given, and the record shows conclusively that all other recent Wyoming projects were initiated subsequent to the above described work upon the Greeley-Poudre enterprise in Colorado.

Notwithstanding the Colorado work, Wyoming and her citizens, early in 1908, commenced new projects for utilizing water from the same stream almost six years subsequent to the beginning of the work upon the Greeley-Poudre project in Colorado.

(c) *April, 1908,—Sept. 8, 1909.*

Work continued during 1908 and 1909 on the Laramie River portion of the system, although not to the extent in 1907. (1757, 1798, 2058.)

During 1908 the work progressed upon the plains division. A contractor, who had taken charge of the plains work, stopped his principal efforts during June, 1908, but continued to do some work after that. (2062.) Some work was done on the Black Hollow Cut of the Greeley-Poudre Canal. All plains excavation that year was paid for in script of the company and was done on the extension of the Poudre Valley Canal. (1799.)

The panic of 1907 required re-adjustment of the financial affairs of the defendant, The Laramie-Poudre Reservoirs & Irrigation Company. The general result of this re-adjustment was the formation of the lands, for the irrigation of which the project had been in construction since 1902, into the Greeley-Poudre Irrigation District. This organization began in the early part of 1908.

Mr. Camfield testified as follows:

> "Early in 1908 I began consideration of proposed system of works, water supply and general conditions surrounding the Greeley-Poudre project. Had thoroughly familiarized myself with everything connected with the project long prior to that time. Became interested through efforts of Mr. Hibbard. Had several meetings wit Mr. Hibbard and Mr. Duvall and also another engineer, Mr. Green. Also Mr. Charles R. Hedke, engineer. We went over entire matter and considered everything in Poudre Valley and on Laramie River. * * * *At that time had general understanding of condition of works then in course of construction to accomplish diversions of Greeley-Poudre system from Laramie and*

Poudre Rivers. They had been working on the system prior to that time. (2156-7.)

* * * * * * * * * * *

After making investigation of Greeley-Poudre project and considering the possibilities of same from every standpoint, I bought 23 per cent of stock in The Laramie Poudre Reservoirs and Irrigation Company. (2159.)

* * *

Approximately $800,000.00 had been expended before we went into company. This had been expended in promotion and construction of system. Prior to my entering and purchasing stock, I had understanding with stockholders that I would buy only on condition that irrigation district would be formed. * * * Soon after I bought into the company, we made arrangements for formation of irrigation district. District finally formed in 1909."

The $800,000 which had been invested in the project included cost of purchase of additional property, such as the Mitchell Lakes reservoirs in the Cache la Poudre Valley, in addition to that which had been expended in construction and other like expenses, the amount of which has been previously given.

April 3, 1909, (1811) the lands to be served by the system in the process of construction since August 25, 1902, by the defendant, The Laramie-Poudre Reservoirs & Irrigation Company and its predecessors, were formed into defendant, The Greeley-Poudre Irrigation District. This public corporation on September 8, 1909, entered into a contract with The Laramie-Poudre Reservoirs & Irrigation Company whereby that company was to complete its project and thereafter turn the same over to the district for the irrigation of its lands.

It is unnecessary to go at length into the details of the organization of this district and the contract with the company, all of which will be found in the testimony of engineer John R. Wortham (1602-1722) and engineer Charles R. Hedke (1820-32, 1835-55.)

The contract with the district involved no change in the Laramie River portion of the system except that the work upon the collection ditches for diversion and carriage of water to the west portal of the tunnel was shifted largely to the two lower collection ditches. The one and only reason for this change is thus given:

"Plans for constructing the remainder of this Upper Rawah Ditch, adopted subsequent to 1907, were that after 1908 they started construction work on the tunnel

and the two collection ditches in the valley, the one from Deadman and the one from Rawah, and it was decided that we could do the remainder of the construction work on the Upper Rawah Ditch cheaper with maintenance crews than we could by putting gangs up there and keeping them there. After we could get the rest of the system running, we could put our maintenance men up there and have them there in case there was any break in any of the ditches, and at the same time keep them working at construction work on the Upper Rawah Ditch, back to McIntyre Creek.

There never was any intention of abandoning the Upper Rawah Ditch. That ditch is an essential and necessary unit of the system. It has been carrying water and discharging into the West Fork of the Laramie River since 1904." (2058-9.)

1909-1913.

September 8, 1909, the general contract was made between the defendants, The Laramie-Poudre Reservoirs & Irrigation Company, and The Greeley-Poudre Irrigation District. A general description of construction will suffice. The two and a quarter mile tunnel of the system was completed at a cost of $600,000 (1652, 1772) before the closing of construction as a direct result of this suit and its influence upon the sale of the bonds and securities of the Irrigation District (Camfield 2163-5; Iliff 3653-62, 3665-70, 3682-7, Decree, Ex. 179.) This tunnel has a carrying capacity of 1,000 cubic feet per second (1853) and its prosecution continued day and night (1652.) The difficult portions of the two lower collection ditches on the river were completed at a cost of $233,503 to the district (2125.) About $20,000 was expended on the tunnel reservoir (1860) and numerous other smaller units on the Laramie River were either wholly or partially completed. On the Poudre River side, the work proceeded upon the entire distribution portion of the system. Contractors were engaged on the different canals and reservoirs upon the plains and but little work remained to put the distribution system in running order for the use and application of the waters of the Laramie River. A more detailed portrayal of the magnitude of this system and the work done upon it during these years appears in the testimony of Charles R. Hedke (1723-83), construction engineer for the company, and John R. Wortham, engineer for the district (1602-1722, 2078-2137.)

After August, 1911, the Greeley-Poudre Irrigation District, at an expense additional to that provided for in the contract with the company, constructed concrete lining in the tunnel

under the direction of Mr. Wortham, its engineer. This work was finished May 1, 1914 (1628). Charles R. Hedke severed his connection with the construction company February, 1911, and at that time $1,825,000.00 in cash (not bonds) had been expended on the Greeley-Poudre system (1779). The subsequent tunnel lining by the district cost $20,720.19 in cash (1654).

At the time of taking the testimony in this case, the Greeley-Poudre Irrigation District had expended upon this system the sum of $3,046,780.00 in bonds, on account of the construction (2139), and also the additional sum of $8,500 in cash (1656), for the completion of the approach cut from the Laramie River to the west portal of the tunnel. On the Laramie River portion alone over $900,000 had been expended by the district and its predecessors (1654, 1772, 1795, 2047, 2125). These amounts represent the sum total of the expenditures on the project from August 25, 1902, to the date of the close of the testimony in this case, and include not only those made by the district, but as well the expenditures made by The Laramie-Poudre Reservoirs & Irrigation Company and its predecessors, the sum total of which was about $800,000.00 at the time Mr. Camfield bought into the company. More than two million dollars of bonds of the district were expended in construction and in payment under the terms of the contract from September 8, 1909, to the summer of 1913. In February, 1911, when Mr. Hedke severed his connection with the company, a great part of this expenditure had been made.

Of continuity of work from 1904, when he became associated with the project, Mr. Hedke makes the following general statement:

> "Work and expenditure of money upon the system now known as the Greeley-Poudre system was continuous and uninterrupted from 1904 until February, 1911, at the time I severed my connection with the Company. It was done under some difficulties and conditions that showed remarkable progress for these conditions and difficulties." (1776.)

The witness then continues to describe, more in detail, the progress made, concluding with the remark that a world's record was made during the drilling of the tunnel (1776-9).

Record of each of surveys upon each unit was made. Proper filings were made in the office of the State Engineer of Colorado. Copies of these filings were introduced as Plaintiff's Exhibits N to T inclusive (1835-9), and also, in part, as Defendants' Exhibits 51, 74 and 75.

All of these filings are merged into the decree of the Dis-

trict Court of Larimer County, Colorado (Defendants' Exhibit 179), wherein the court, after reviewing the history of the enterprise from the initial survey and specifically finding that more than ordinary diligence had been used, fixes the priority of the enterprise as of August 25, 1902. No appeal has been taken and the decree is final and binding upon all Colorado appropriators.

Regardless of the decree of the District Court fixing August 25, 1902, as the priority of the Greeley-Poudre project, the fact remains that under the doctrine of relation (by which priority dates as of initiation of the enterprise), the priority of right of this system to divert water from the Laramie River would date as of August 25, 1902, the date of the beginning of the first survey, a date, as we shall observe, years prior to the first initial act in any way having to do with those Wyoming projects in whose behalf this suit is prosecuted.

(5) *Errors in Plaintiff's Brief.*

Plaintiff seeks to obscure the true dates of the initiation and priorities of the early Greeley-Poudre enterprise in Colorado on the one hand, and the very recent and far junior Wyoming enterprises (principally Lake Hattie and James Lake) on the other hand, by two erroneous and wholly unwarranted assumptions:

(a) That Colorado seeks to claim priority for her Greeley-Poudre enterprise as of 1897, when, in truth, August 25, 1902, is the only priority for that system asserted by defendants in their answer, established by the evidence or fixed and determined by decree of the District Court of Larimer County, Colorado, in adjudication of water rights in Colorado; and,

(b) That the Upper Rawah Ditch, one of the three necessary collection canals of the Greeley-Poudre system, constructed for the diversion and carriage of water from tributaries of the Laramie River back to the tunnel portal, never was intended as or to be a part of the system.

(a) *Erroneous Priority Assumptions.*

The first of these assumptions finds no foundation in either the pleadings or the record. In truth, possibility of a tunnel, collection ditch and reservoir system similar to that of the Greeley-Poudre Irrigation District on the Laramie River, first came to the attention of Wallis A. Link in 1897, while he was searching for a wounded deer on the mountains over the location of the now completed Greeley-Poudre tunnel. Mr. Link later interested Mr. A. I. Akin in the plan and drew a rough plat showing the general location of the tunnel and the three (not two) collection ditches which he exhibited to Akin and early in

1902 he and Mr. Akin visited this remote region and made reconnaissance of the whole tunnel and collection ditch scheme. As a direct result of these efforts upon the part of Link and Akin, the first and initial survey was commenced on the project August 25, 1902. (1929-35, 2039-42.)

These uncontradicted historical facts are interesting and of some value to show the system first conceived by Mr. Link in 1897 and later planned by Link and Akin in 1902, to be, in all essentials, the same project now partially completed for the Greeley-Poudre Irrigation District, but are but preliminary and no more vest a priority of right to the appropriation of water than would the early search for mineral by a prospector constitute the location of a mining claim.

Priority for the Colorado enterprise is not predicated upon these preliminary acts of Link and Akin, but entirely upon the commencement of survey, August 25, 1902, since which time work has proceeded with diligence and continuity. (1935, 2039.)

The answer of Colorado, on page 8, reads:

> "Defendant avers that other appropriations of said water of said Laramie River and its tributaries have been made by the State of Colorado and its citizens within the State of Colorado, prior to the appropriations of said waters by complainant and its citizens, as set forth in the complaint, *and avers that on the 25th day of August, 1902*, the defendant, The Laramie-Poudre Reservoirs and Irrigation Company and its predecessors in title, by commencement of construction, initiated its rights to the diversion * * * through the tunnel mentioned in the bill of complaint, * * * and that at the time of the initiation of said rights of the defendant, The Laramie-Poudre Reservoirs and Irrigation Company and its predecessors in title, there was abundant water in said stream to satisfy *all prior appropriations then in existence in the State of Colorado and in the State of Wyoming.*"

To the same effect are the averments on page 15. On page 8 of answer of corporate defendants, the averments appearing on page 8 of answer of the State of Colorado are substantially repeated, and on page 15, among other averments to the same effect, corporate defendants say:

> "* * * that prior to the initiation of this suit—that is, *on August 25, 1902*—the construction of said system was begun by a predecessor in title of these defendants * * * that *defendants are the owners* of all rights so initiated *August 25, 1902.*"

On page 19 corporate defendants say:

> "* * * that long prior to the initiation of this suit—to-wit, *August 25, 1902*—and while there was abundant unappropriated water in the run-off of the Laramie River * * * predecessors in title of these defendants initiated, by commencement of actual construction on *August 25, 1902, the water rights which are sought to be exercised by diversion through the tunnel* mentioned in the bill of complaint; that since such initiation, the defendants and their predecessors in title, have diligently, by continuous work and expenditures on the construction of an extensive irrigation system, preserved the rights so initiated."

August 25, 1902, is the only date of priority for the Greeley-Poudre enterprise asserted or claimed by the defendants. The District Court of Larimer County, Colorado, so decreed (Exhibit 179), and no contradictory evidence appears throughout the entire record. Nowhere are defendants heard to assert any earlier priority for the enterprise.

To urge that an adversary is entitled to a senior priority is unusual between contending appropriators. The opposite is almost universal. Colorado here asserts and conclusively proves that she is entitled to priority as of August 25, 1902, the date of commencement of the surveys in conformity with which her project has been constructed, and no earlier, and yet Wyoming argues, in her brief (in which Colorado does not concur), that the Colorado appropriations are asserted as of 1897.

The reason for this unusual, and somewhat mysterious argument, is alone revealed by that portion of the Wyoming brief wherein she seeks credit for one of her own recent 1908 enterprises (the Lake Hattie Reservoir), for a few random and wholly irrelevant reconnaissances made during the past twenty years, and which, according to the Wyoming testimony, had very little in common with each other and absolutely no bearing upon and were in no manner connected with the Lake Hattie enterprise. (660-1, 665, 770-1, 935, 971-5.)

We shall later discuss these random, disconnected "surveys" more in detail when considering the Wyoming appropriations, and particularly the mythical "Pioneer Highline Canal." For the time being it is sufficient to say that the testimony shows, without contradiction, that the survey of the Lake Hattie project was begun April 16, 1908 (650) by an engineer who had no knowledge of and whose work was entirely foreign to any former reconnaissances or so-called "surveys." (661.)

For Wyoming to admit the true priority of her project (1908) would be to admit that the Greeley-Poudre (Colorado)

enterprise is almost six years senior. Rather than make such admission, cover is sought in suggesting that by some vague legal fiction, and notwithstanding all the pleadings and proof, excuse might be found for urging a date for the Colorado appropriation five years earlier than August 25, 1902, by reason of the early preliminary efforts of Link and Akin. If this argument is sound, then, it is argued, some semblance of excuse exists for Wyoming to contend that her new projects, in whose behalf this suit is brought, by some stretch of legal fiction may possibly be entitled to priority somewhere between 1886 and 1908, according to which one of the few random and heretofore abandoned efforts may be selected, notwithstanding no previous assertion of any such claims, all of which are long since forever barred by Wyoming statutes.

In other words, only by urging that Colorado does not claim enough may Wyoming find fiction for claim anterior to the Colorado system. With this evident purpose, counsel refer to certain evidence of witness Wallis A. Link, frequently designated as Wallace A. Link, wherein he stated that he first observed the opportunity of building the tunnel in 1897, while searching for a wounded deer in the vicinity, but that he took no steps toward completion of the system at that time (193), and, contrary to the pleadings and all the evidence, say:

> "It is the purport of the evidence for the defendants that the tunnel, which was commenced twelve years later, had its origin in this episode." (P. 22.)

The next portion of the brief, which we quote, shows that by the use of the word "origin" is meant "priority."

This line of thought must have originated in the mind of counsel, for they are the first to so utter. The purpose of this attempt to confuse the time of the initiation of the Greeley-Poudre project by the creation of a fictitious claim on behalf of defendants, is self-evident:

> "In view of the contentions of Colorado that the Greeley-Poudre system is entitled to assert a priority of appropriation relating to the time of the *vision* of Wallace Link, despite the many years before any real work was performed, it is interesting to note that the Lake Hattie system was constructed by the owners of the Pioneer Canal after their predecessors had made surveys from time to time since 1886," etc. (P. 76.)

If the court can be convinced, contrary to the truth, that Colorado claims priority for the Greeley-Poudre enterprise from 1897, at the time when the possibility of the enterprise was first casually observed by Wallis A. Link, and that she is

attempting to take advantage of certain reconnaissance work thereafter done by the early projectors of that enterprise prior to initiating the actual surveys on August 25, 1902, then pretext may exist for attempting to assert an anterior priority for the Lake Hattie enterprise. Unfortunately for counsel, the evidence conclusively shows that while certain disconnected reconnaissances were made by some three or four persons during a period of twenty years prior to 1908, these so-called "surveys" had no relation one to another and none of them to the Lake Hattie system, so that in no event might that system claim semblance of priority anterior to 1908 or to August 25, 1902, the priority of the Greeley-Poudre enterprise.

For the present, we say that for the Greeley-Poudre enterprise to attempt (which it most decidedly does not) to assert priority upon the early efforts of Link and Akin prior to August 25, 1902, or upon what is termed by counsel for Wyoming the "vision of Wallace Link," rather than by authority of the initial surveys leading to the final construction of the project, would be almost as spurious as the attempt to cloud the issues by so-called "surveys" which had no part in the initiation of the Wyoming enterprise. It is true that the early efforts of Wallis A. Link and later of Link and Akin, prior to August 25, 1902, were a broken series of acts having the one common end of building the tunnel and collection system, and none other, and were put forth by the men who were finally instrumental in setting in motion the final construction of the enterprise. It is also true that they continued to be financially and otherwise interested long after construction commenced. But these facts are wholly unlike the "visions" of some of the residents of Wyoming prior to April 16, 1908, to the effect that at some distant time or by some future generation an imaginary canal (not reservoir system), which still remains a fiction, might, and may be, constructed upon the Laramie Plains, all of which "visions" and all acts in consequence thereof were disconnected with one another and wholly foreign to any enterprise now in process of construction.

The Colorado enterprise began August 25, 1902, and the Wyoming enterprise April 16, 1908, and not before, and erroneous assumption of fancied claims, or gathering together of random ideas or disconnected acts, can no more vest any other priority in the Wyoming enterprise than can the "wounded deer" incident of Wallace Link justify other or earlier claim by Colorado. The date when work actually and definitely began in good faith upon each enterprise fixes its priority.

(b) Erroneous Assumptions in Re Upper Rawah Ditch.

The assumption that the Upper Rawah Ditch was not

originally intended to be a part of the Greeley-Poudre system is equally in error. This supposition, however, is evidently made with a different and more natural design, viz., to try to discredit the earlier construction upon the Greeley-Poudre enterprise in order that semblance of accuracy may be given to the contention that very little had been done upon the Colorado enterprise prior to April 16, 1908, when the newer Wyoming enterprise was actually initiated, notwithstanding more than $296,000.00 had been expended in construction, equipment and supervision, and upwards of $800,000 for all purposes, upon the Colorado system during the five and one-half years prior to 1908.

The argument advanced by counsel in support of this new theory is founded on substantially the following facts and suppositions:

The Greeley-Poudre system has two canals on the west side of the Big Laramie River in Colorado, constructed for the purpose of collecting water from tributaries and carrying the same to the west portal of the tunnel. One is located high up on the mountain sides, nearly at timberline, and is known as the Upper Rawah Ditch, and the other at a lower elevation and diverts and carries whatever water the upper ditch fails to capture and is known as the Lower Rawah or West Side Ditch.

The *Upper Rawah Ditch, of 22¼ cubic feet per second carrying capacity,* discharges its waters directly into the West Fork of the Laramie River, whence it flows down to the tunnel. It so happens that *a part* of these waters may be (but never were) captured and carried out of the Laramie watershed by the Skyline Canal of The Water Supply and Storage Company, constructed during the 90's for the diversion of water flowing in the West Fork. This later canal has a carrying capacity of only *130 cubic feet* per second, and at times, when there is not sufficient water in the West Fork to completely fill the canal, *some* space is available wherein *a small portion* of the 224 cubic feet per second of the water of the Upper Rawah Ditch might be (but never was) carried through the Skyline Ditch, if proper arrangements to that end were made with the owners of the canal. In such case *all of the remainder of the 22¼ cubic feet of water* from the Upper Rawah Canal must, of necessity, pass down the West Fork, and to the Laramie unless intercepted by the tunnel.

Climatic conditions limit operation of the Skyline Ditch to a few months in each year, and during the greater portion of that time its carrying capacity is utilized by its own appropriation and there is no opportunity to carry even a small part of the water from the Upper Rawah Ditch except during a very brief interval in each year.

To attempt to carry the 22¼ cubic feet of water per second from the Upper Rawah Ditch through a small available portion

the *130* cubic feet capacity of the Skyline Ditch, would, to e the common phrase, be attempting to insert "a square stick to a round hole."

Those who had charge of early construction upon the Gree-y-Poudre system do state that some temporary (not perma-nt) arrangement was made with the owners of the Skyline anal to use any available space in that canal for the carriage a part (not all) of the waters from the Upper Rawah Ditch ring the period of years necessarily required to construct the nnel portion of the Greeley-Poudre system. Thus early use ight be (though never was) made of a small part of the water the Upper Rawah Ditch in much the same manner as a street temporarily occupied during repairs upon adjacent build-gs. The Greeley-Poudre parties had no other or different ght-of-way through the Skyline Canal and had no right to en-rge it or intent so to do.

Counsel for Wyoming presume to argue that, because a all part of the Upper Rawah water *could be temporarily* con-yed to the Cache la Poudre Valley by means of the Skyline tch, and because those in charge of the project saw fit to per-rm a part of the early construction upon this upper unit of e system in order that advantage might be taken (if desired) the temporary arrangement to carry a small part of the water rough the Skyline Ditch, this Upper Rawah Ditch should be eated as a separate construction, as no part of the general stem and of no use to the tunnel enterprise.

All those who directed early construction upon the Greeley-udre enterprise appeared as witnesses. The testimony upon l phases of the early history was complete and at consider-le length. From this entire testimony not the slightest foun-tion can be obtained for any such theory as that advanced. he whole record shows, without the slightest contradiction, at the three collection ditches, including the Upper Rawah itch, were, from the outset, considered and treated as a part the tunnel project; that they were so portrayed long before y surveys took place; that they were so considered by Link d Akin while they were going over the project during 1902, d that each of the three ditches are a necessary and essential rt of the system now in process of completion.

Wallis A. Link, A. I. Akin, and Engineer Zac T. Duvall d Charles R. Hedke, testified concerning the earlier con-ruction. We shall quote at some length from their uncon-overted testimony. Of efforts prior to initiation of enterprise,

allis A. Link says:

> "Am acquainted with the location of the Greeley-Poudre tunnel. I located it." (1929.)

He then goes on to describe the occasion for his discovery of the tunnel site and continues:

> "I was the originator of the *entire proposition as now constructed or planned.* I moved to Fort Collins in 1901. * * * While living there, became acquainted with A. I. Akin. * * * Imparted to him information I possessed as to possibility of system to be constructed for diversion of water from Laramie River *by means of tunnel, east and west side collection ditches and upper collection ditch.* Explained it to him some time during spring of 1902. * * * I explained to him the proposition and *made a sketch map* or chart of it.
>
> In making this sketch map, *I described* the *tunnel* and the *collection ditches coming to and feeding this tunnel.* * * *
>
> Akin and I made trips * * * down the West Fork and East Fork * * * about 1,000 feet distant from the west portal of the Greeley-Poudre tunnel. I explained to him the system." (1930-2.)

He then explains his early plan for opening construction in the first instance on the Upper Rawah Ditch rather than on the lower collection ditches:

> "We adopted a method by which we were to build a part of the system first and employ the same to demonstrate the flow which was obtainable and also to assist in obtaining money for further promotion. After our first trip to Link Lakes and over that country, we thought that the first thing to do would be to build this ditch and connect it up with the Skyline Ditch, as this" (referring to the Upper Rawah Ditch) *"being a unit of the whole,* would retain our franchise and still give us revenue to proceed in the construction of the work. * * * We visited Link Lakes. I explained to Mr. Akin the line I proposed for this first construction. I had been over to these Link Lakes on many occasions and knew the country thoroughly. *I knew the comparative elevation of necessary ditch lines and also of tunnel.* I showed Mr. Akin at that time the line where I thought the ditch would go." (1932-3.)

The survey upon which the priority of the system is predicated is next described by Mr. Link:

> "Later on in the season (1902) we had the line surveyed. The line established by the survey did not vary from the line I conceived and explained to Mr. Akin.
>
> Frank Beach, civil engineer, was taken up there

* * * to survey the proposition. Mr. Akin and I paid for the work. We had him first survey the Link Lake Ditch, which they now call the Upper Rawah Ditch.

Survey commenced August 25, 1902. Mr. Beach, Mr. Akin and I were engaged in the work.

I remember the surveys made by Mr. Duvall, the engineer, who testified just previous to me. *The lines* which he established for the lower ditches *corresponded just as near as can be with the lines we had charted.*" (Referring to Link and Akin prior to survey.) (1934-5.)

Witness next described the difficulties of getting into the mountainous country with pack animals, owing to natural obstacles, and details of the survey; also some slight changes on the Upper Rawah Ditch between the Duvall survey of 1904 and the Beach survey of August 25, 1902.

Mr. A. I. Akin says, in part:

"This project was first called to my attention in the spring of 1902 by Wallace A. Link. Made first investigation trip to Laramie River in Colorado in July, 1902, with Wallace A. Link. Went up there with him to look up prospect of bringing water into the Cache la Poudre River. * * * Were gone six or seven days.

I last saw the Greeley-Poudre Irrigation District system of works on the Laramie River in September, 1913. *System now in process of construction is same system early conceived by Mr. Link and me.* The ditch indicated on Defendant's Exhibit 74 is a part of the Greeley-Poudre system." (Referring to Upper Rawah Ditch.)

"*In July, 1902*, in addition to inspecting the land occupied by the Upper Rawah Ditch, *we looked over* the general lay of the country all up and down the Laramie River and also *the tunnel line. We checked the ground over in a general way for the entire system.* The only surveying done in 1902 is shown on Defendant's Exhibit 74. We had no other data from which to prepare maps." (2042.)

"*Diversion system* portrayed on three maps, Defendant's Exhibit 51 (Duvall map), 74 (Beach map) and 75 (Tenney map) *is practically the same system as conceived by Mr. Link and me in our exploration of 1902.* The Beach survey was preliminary, as was also Tenney's survey. The Duvall survey was definite location." (2049.)

Speaking of the 1902 surveys, he says:

"In August 1902, took engineer Frank Beach from

Fort Collins. * * * Packed up to Link Lakes and ran survey line up from upper lakes across to West Fork of Laramie River. *He began his survey August 25, 1902*, that was the day he actually began on the ground. * * * We were engaged in this survey about 15 days.

During that time we surveyed line of Upper Rawah Ditch." (2039.)

"Mr. Beach made plats of survey made by us and we filed that, Mr. Link and I, with the State Engineer; defendants' Exhibit 74 is a copy of the map prepared by Mr. Beach.

Am familiar with line of Upper Rawah Ditch as now constructed. The present line is nearly same as location shown on Exhibit 74." (2040.)

"Statement of claim indicates carrying capacity of ditch to be 224 cubic feet per second. That was size of ditch contemplated by us at the time.

On Defendants' Exhibit 74, the ditch and reservoirs are termed 'Link Lake Ditch and Feeders and Link Lake Reservoir.' That was afterwards changed to 'Upper Rawah Ditch.'" (2041.)

Mr. Link describes the construction of necessary roads during the entire working season of 1903, cut over the mountains and through the heavy timber. He further says:

"The object of building this road was for constructing the system." (1942.)

Mr. Link, after stating that new parties became interested during the winter of 1903-4, says:

"The line of ditches as *we had designated* and *designed them were explained to our associates* and *I made charts showing line of tunnel and platted entire proposition.*

The five of us *concluded we had better make survey of tunnel as early as possible*, and so I took a team and surveyed line for tunnel. * * * Left Fort Collins * * * March 9th. * * * Took about two weeks from time we left Fort Collins. * * * There was a great deal of snow on tops of mountains. * * *

Site surveyed by Mr. Tenney is in practically same place previously selected by me.

After return of survey party to Fort Collins, Mr. Tenney made up notes of his survey and Mr. Hedke was engaged with him figuring out distances and other like work. * * * Mr. Tenney ran fly line to East Fork Reservoir to tunnel. This was done about March 15,

about same time we surveyed line over tunnel." (1947-9.)

"The association then employed Mr. Duvall to make elaborate surveys of the entire system."

The witness continues:

"*Got Mr. Duvall* and went to work making *final survey of tunnel.* Men had been working road to West Fork of river all time I was gone. *Survey was continued on throughout entire summer of 1904, during which time the entire mountain system was surveyed.* Mr. Duvall first commenced surveys on tunnel in May, but had to discontinue on account of snow. * * * *The line for tunnel selected by Mr. Duvall was about the same line selected by Mr. Tenney and myself.* Lines might vary a few feet from one another. Other lines were run to ascertain which was best line." (1951-2.)

"$13,000 to $14,000 was expended during that summer. *Upper Rawah Ditch was also surveyed in 1904. Final line was run and most of it cross-sectioned.*

The line finally selected was practically the same line selected by Beach in 1902. * * * It was practically the *same line designed by me before survey in my first conversation with Mr. Akin.* There was a great deal of construction work done in 1904 outside of surveying. * * *" (1953-4.)

"*Work was done*" (in 1904, prior to any construction on the Upper Rawah Ditch) "*on floor of Laramie Valley* nearly level with *west portal of tunnel.* * * * It was *so constructed that water flowing from the west side collection ditch, as well as from Upper Rawah Ditch, would be carried across and into the tunnel.* First clearing in any part of the project was on east fork reservoir and next clearing was on this ditch line from *West Fork to the tunnel.*

It would be *impossible to take water* diverted or carried by this East Fork Reservoir or the ditch from the West Fork of the Laramie River to the tunnel out of the Laramie Valley by *any other means than by a tunnel.* It was *impossible to take it out by the Skyline* or any other canal." (1954-5.)

The East Fork Reservoir was located just above the present tunnel reservoir of the system, the latter having been substituted for the same purposes for which the East Fork Reservoir was originally planned. (1845.)

The first actual construction on any of the several units of

the system is naturally indicative of the original intent of the parties.

> "*First work of construction following any surveys on this entire mountain system,* exclusive of road work, was done on East Fork Reservoir and *on line of ditch leading from West Fork of Laramie River to west portal of the tunnel.* * * * This was first work along any surveyed line. * * * I mean work of excavation done on the ditch, the survey of which had been located and cross-sectioned by engineer." (1958-60.)

Mr. Link further said:

> "The cost of the work which I had planned was estimated at about $2,000,000." (1988.)
>
> "We had an arrangement with the owners of the Skyline Ditch to carry our water for a percentage. *About 130 second feet* had previously been carried through their ditch, which *was practically its capacity,* and *we had no arrangements for its enlargement.* During the flood period in May and June the owners of that ditch had enough water to fill it and would have none of our water carried through it during that time." (2002.)

Of the original project:

> "I am familiar with File No. 1417 (State Engineer of Colorado), made in name of Myron H. Akin in May, 1904, covering the *tunnel,* the East Fork Reservoir and other portions of this system. At the time this was made, the two lower supply ditches were contemplated, but surveys had not been commenced.
>
> Filing No. 1722, made October 6, 1904" (Defendants' Exhibit 51) "* * * was made on behalf of our association. *It shows the tunnel, the West Side Supply Ditch, the East Side Supply Ditch and the Upper Rawah Ditch, and was made for the purpose of combining our entire project as then contemplated."* (2014.)
>
> "That is the same filing identified by Mr. Duvall and pertaining to surveys made by him. *This map does not pretend to show anything else than surveys made by Mr. Duvall.*
>
> Filing No. 1417 (State Engineer's office number), pertained to Mr. Tenney's survey and the contour line of East Fork Reservoir. * * * The tunnel line is Tenney's survey. If the East Fork Reservoir is omitted from Exhibit 51, it does not signify that Mr. Duvall did not see the reservoir. I do not know whether he did any work on it.

Actual cost of construction is the true gauge and not estimates of engineers. Estimates have nothing to do with the real cost, as we found out." (2029.)

"I was the explorer in a sense. The forerunner of the proposition and directed where those lines should be run. *If we could not have made our objective point, the tunnel, from those streams, then it would not be feasible.*" (2020.)

Mr. Akin:

"Mr. Tenney began his survey March 12, 1904, on the tunnel. 'Defendants' Exhibit 75 shows the R. Q. Tenney survey." (2046.)

"Was with the surveying party of Zac Duvall during most of the season of 1904. Have seen *Defendants' Exhibit 51*, known as *Duvall's map. It shows Upper Rawah Ditch and two gathering ditches*, the East Side Ditch and West Side Ditch * * * and *the tunnel line.* Mr. Duvall did no engineering work on other units or parts of the system than those shown on Exhibit 51." (2049.)

Of the first actual excavation on the system, Mr. Akin says:

"*First work done in 1904 was in construction of ditch from West Fork to East Fork of Laramie River and to tunnel.* In 1904 construction work was carried on on Upper Rawah Ditch. During period of construction of 1904, I was there nearly all the time, back and forth from Fort Collins. Have heard testimony of Mr. Duvall, and Mr. Link concerning construction work going on in 1904. They stated the facts in that regard." (2046.)

Zac T. Duvall, civil engineer, testified:

"*My first acquaintance with the Greeley-Poudre system was in 1904, when I was engaged as an engineer for the permanent location of the tunnel. Also had charge of permanent location of Upper Rawah Ditch.* I ran preliminary lines for East Side Collection-Ditch and West Side Collection Ditch. R. Q. Tenney of Fort Collins, Colorado, preceded me in laying out the *preliminary lines for the tunnel. Mr. Beech* had preceded me in the *preliminary surveys of the Upper Rawah Ditch.* * * *

I was under the immediate direction of Wallace A. Link while engaged on the work. *I began work on the Laramie-Poudre tunnel of the Greeley-Poudre system May 23, 1902.* I found evidences of preliminary survey

which had been made by R. Q. Tenney. *I did not vary to any considerable degree from that preliminary line."* (1882.)

"I also located the inlet ditch for the tunnel from the West Fork of the Laramie River across the East Fork and into the tunnel.

Plaintiff's Exhibit P" (identical with Defendants' Exhibit 51) "represents the survey I made during the season I was there. It indicates nothing else than the surveys made by me. The *tunnel line* located on the map is the one finally selected by me. *The inlet ditch of which I spoke is located on this map.* • • • *This ditch was constructed to carry water from the West Fork to the East Fork and to the tunnel. The waters of the Upper Rawah Ditch are discharged* into the West Fork and down that stream and *into this inlet ditch and then into the tunnel."* (1884.)

"In addition to locating the *inlet ditch* from the *West Fork* to the *west portal* of the *tunnel,* I constructed about 500 or 600 feet from the *canal and turned water in* from the West Fork of the Laramie River *June 10, 1904. That was the first actual excavation work on any part of the Laramie River system.* Water ran through that portion of the inlet ditch which we constructed from the West Fork.

After constructing this portion of the ditch, I went to the outlet end of the Upper Rawah Ditch and commenced permanent location of that canal to Rapid Creek, so that the right of way could be cleared for excavation and afterwards continued the survey through to Rawah and McIntyre Creeks. The line thus permanently located by me was practically the same from the outlet end of the ditch to Rapid Creek as the line located by Beach. • • • So far as diversion of water is concerned, the line I selected is practically the same as that laid out by Beach." (1885.)

"The Upper Rawah Ditch which I have located was designed to gather water in the higher elevations northwest of the West Fork and we could either carry it through the Sky Line Ditch into Chambers Lake or down the West Fork into the tunnel." (1901.)

"I completed the engineering work on two lower collection ditches on October 1, 1904. I worked on these ditches during August and September, after leaving the Upper Rawah Ditch and completed both surveys, one on east side and one on west side of Laramie River. • • • These two ditches together constitute what is

now called the Lower Rawah or West Side Collection Ditch and the East Side Collection Ditch." (1891.)

"*I have been on the ground since the tunnel constructed* by the Greeley-Poudre Irrigation District and the Laramie-Poudre Reservoirs & Irrigation Company was completed. *The line of tunnel thus completed is the same* as the *line of tunnel* indicated on the map, Plaintiff's Exhibit P." (Same as Defendants' Exhibit 51.) (1885.)

"Plaintiff's Exhibit P represents work done in the year 1904. I did not assume to represent any other work done by any other engineer prior to that time." (1891.)

"Estimated capacity of tunnel I located and designed was 1,000 cubic feet per second." (1892.)

Charles R. Hedke, civil engineer, to whose supervision was entrusted the construction of the Greeley-Poudre enterprise, says, in part, as follows:

"*My first acquaintance with the Greeley-Poudre project in the Laramie Valley was in 1904, when there was under consideration a diversion of water from the Laramie River to the Cache la Poudre River by means of a tunnel.* The matter was brought to my attention and discussed. Persons working on the project consulted me at that time. I began active operations in connection with that system in 1905. * * *

My work in 1905 consisted of a general analysis and special detailed surveys as a means of applying the water from the Laramie River to lands in the Cache la Poudre Valley, and also work in connection with the settlements between the contractors and the owners of the Laramie River system, upon work done on the Laramie River system in the year 1904, upon the unit of the Greeley-Poudre system now called the Rawah Ditch. It is sometimes called the Upper Supply Ditch, and is situated on the west side of the Laramie River Valley at an altitude of about 10,500 feet, and work had been done the years previous and the contractors were forced to go out of the country on account of the snow, and final and complete estimates were not made that year but were completed and made by me in 1905. * * *

The work performed to that date was of a very good character. Very good class of mountain ditch construction. Between 4,500 and 5,000 feet of mountain ditch construction had been completed at that time. * * *

There had been actual construction done before I became associated with the project. * * *

The 1904 work had progressed under the direct supervision of Mr. Zac T. Duvall, an engineer of Denver, Colorado. In 1904 some work had been done by Mr. R. Q. Tenney of Fort Collins, prior to the time that Mr. Duvall was employed." (1743-4.)

Speaking further of the tunnel and collection ditches, heretofore surveyed by Tenney and Duvall during the year 1904 and constructed 1905-11 under the direction of Mr. Hedke, he says:

"The final line of the tunnel was placed on exactly the same line that I found surveyed in 1905, after all possible other considerations had later been taken into account. That was the line of the Duvall and Tenney surveys.

The collection ditches of the present system were outlined at that time. Minor changes, due mostly to the size and character of the enterprise and the existing conditions, and also brought about a better class of construction than originally contemplated, have been made.

The system as a whole is the same for all practical purposes." (1747.)

Speaking further of the tunnel, he says:

"Tunnel may be considered most important unit of the system. It is the means of diverting water through the divide between the watersheds and is very important. Tunnel *completed August, 1911."* (1778.)

"The *tunnel* was actually *constructed on the lines* shown on the *map* filed October 6, 1909" (Duvall map, Defendants' Exhibit 51), "and not on lines shown by subsequent maps." (1843.)

"It is a fact that the construction of the tunnel was the culmination of efforts beginning with Link and Akin and early designated by Tenney and Duvall surveys. There is no substantial departure from the original idea. The other surveys * * * were the necessary investigations * * * and further analysis of the entire system, and as each part was done it was filed upon and rights protected as much as possible. They represent in record form the various sidelights upon the enterprise.

At no time was the tunnel plan abandoned. We never had an investigation that suggested the possible

abandonment of the tunnel. It was so apparent almost on its face, owing to the natural conditions, that it was very hard to figure out any means whereby the tunnel would be improved on. * * *

When I have been speaking of the Duvall map, I refer to Plaintiff's Exhibit P, being map of 1904, No. 1722." (1866.)

The system of today is the system surveyed in 1902-4:

"In 1905 the plan of this project as previously made by Mr. Duvall was outlined to me and the system as constructed is substantially the same as was contemplated in that plan. The tunnel as constructed is on exactly the same line as was used by Mr. Duvall, at the west end, with a slight variation at the east end. * * * There was no change in the location of the tunnel from the location shown on the maps filed in the office of the State Engineer."

Finally, in speaking of the various filings made in connection with the maps filed in the office of the State Engineer of Colorado, he says:

"The various dates mentioned on the various maps as the dates of commencement and indicated on Exhibits O and T, inclusive, indicate the dates of actual commencement on that portion of the works. In each case the date was noted on which we started surveying each portion. *These dates do not indicate the date on which the first survey was begun on the system. All surveys were done upon the same general system."* (1873.)

The extensive work constructed both upon the plains and in the mountains during 1907-8 has already been reviewed. Of the work on this canal, Mr. Hedke says:

"The work performed on Upper Rawah Ditch during 1907 was a part of the general work going on over entire system. There was other work going on at that time on plains division." (1767.)

The reason for the change of construction forces from the Upper Rawah Canal to the lower canal after 1908, is thus given by Mr. Akin:

"Plans for constructing the remainder of this Upper Rawah Ditch, adopted subsequent to 1907, were that

after 1908 they started construction work on the tunnel and the two collection ditches in the valley, the one from Deadman and the one from Rawah, and *it was decided that we could do the remainder of the construction work on the Upper Rawah Ditch cheaper with maintenance crews than we could by putting gangs up there and keeping them there.* After we could get the rest of the system running, we could put our maintenance men up there and have them there in case there was any break in any of the ditches, and at the same time keep them working at construction work on the Upper Rawah Ditch, back to McIntyre Creek.

There never was any intention of abandoning the Upper Rawah Ditch. That ditch is an essential and necessary unit of the system. It has been carrying and discharging into the West Fork of the Laramie River since 1904." (2059.)

Very evidently none of the very expensive and difficult construction upon the Upper Rawah Ditch of 224 cubic feet capacity would have taken place had the Sky Line Ditch been considered the permanent outlet to the Poudre Valley for this Upper Rawah Ditch. Mr. Link said:

"The carrying capacity of the Sky Line Ditch is about 130 cubic feet per second. * * * *I had no purpose to enlarge this Skyline Ditch, nor right to enlarge it in any of my plans.* I could not have used that canal in any year, either temporarily or otherwise, until the ditch was fully open to the headgate." (Referring to open from snow and ice.)

"This canal is burdened to its full capacity until July 15th of each year and we could not have obtained carrying capacity in that ditch prior to that date. After that date it might have been possible for them to carry *some* other water. *We would never have been able to obtain carrying capacity to its full capacity. They would always have 30 feet of water in their ditch from the West Fork.*

All the water that we were intending to carry in the Upper Rawah Ditch would be carried through the tunnel to the east side.

Upper Rawah Ditch was built to carry 200 cubic feet per second. It was planned to do that. *Waters of that ditch, when running to its capacity, would not be carried except as to a minor portion, through the unused capacity of the Sky Line Ditch.* This carriage could

only have occurred in a small part of the irrigation season, just a short time in the summer.

It was not our plan to use the Sky Line Ditch as a permanent means of carrying water of the Upper Rawah Ditch.

We would not have built the Link Lake Ditch (or Upper Rawah Ditch) to carry 200 cubic feet per second when we knew that the company owning the Sky Line Ditch would not enlarge their ditch. We did not feel that it would be possible to enlarge their ditch to carry the water on account of the kind of construction involved. * * * The water that we could gather in the Upper Rawah Ditch and carry through the unused capacity of the Sky Line Ditch would not bring sufficient return to warrant all the construction work necessary on the whole system I have described." (2021-3.)

Of the completion of this Upper Rawah Ditch and its capacity, Mr. Akin, who had been actively associated with the enterprise from the opening of 1902 until the taking of testimony, said:

"We got excavation along line of Upper Rawah Ditch entirely completed to point above Rapid Creek. There are portions above Rapid Creek and towards Camp Lake where the work is finished. Right of way is cleared of timber to Camp Lake.

Capacity of ditch as completed from Rapid Creek to West Fork of Laramie River is 22½ cubic feet of water per second of time." (2058.)

"Work was done on this ditch subsequent to 1907."

Statement by counsel for plaintiff (page 25, brief) that the Upper Rawah Ditch is "of little or no value" to the Greeley-Poudre system and that the lower or west side collection ditch now in process of construction serves all the purposes of the Upper Rawah Ditch is not borne out by the testimony. Mr. Link said:

"The West Side Collection Ditch" (referring to the lower west side canal) "was included in the plan prefected by me and, as constructed, *does not perform all of the duties which would be performed by the Upper* Rawah Ditch. The seepage on the mountain sides is very great and it is always advisable to turn the water into a natural channel as soon as possible, and a large part of the water caught by the Upper Rawah Ditch would be lost if not picked up by the West Side Ditch.

• • • We did not contemplate a smaller upper collection ditch on the east side because the mountains were lower, causing a smaller run-off tributary to such an upper ditch, and there are a great many canons making the cost of construction excessive.

I would have constructed the Upper Rawah Ditch under any circumstances." (2003-4.)

"*If the Upper Rawah Ditch had not been constructed, then the west side or lower collection ditch should be built to a much greater carrying capacity than now planned.*

It is far *more feasible* considering the mountain conditions in that vicinity *to build* the *two ditches* on the west side of the river as now planned, *than* it would be *to build one ditch where the lower ditch is constructed*, and of sufficient capacity to handle the water now carried by both ditches.

It is much safer to divide the capacity in the way it has been done. By this means more water is captured, conserved and conveyed to the point desired and a great deal more rapidly than it would be on the single line lower down.

Then you have two capacities instead of one. If one should break, the other would be working. • • •

All these matters were considered and talked over with my associates when we commenced construction of this upper ditch. Mr. Akin and I met with considerable opposition with regard to this upper ditch, but we insisted on constructing this upper ditch because our knowledge of conditions was superior to that of our associates.

Following the plan advocated by myself, work was done on the Upper Rawah Ditch first. That was in 1904 and continued in 1907. This upper ditch was sold later to the Greeley-Poudre Irrigation District." (2024-5.)

(Mr. Link sold out his interest in the system during 1906 and was not interested thereafter.) (1965.)

Further quotation along this line seems unnecessary. The Upper Rawah Ditch, one of the collection ditches of the Greeley-Poudre system included in the initial plans of the tunnel enterprise, was never proposed as a mere extension of the Sky Line Ditch of The Water Supply & Storage Company. That carriage through the Sky Line Canal of a small part of the large quantity of water conveyed by the Upper Rawah Ditch might be made during the period of construction of the tunnel and that such possibility was in the minds of the men who actually initiated, planned and aided in the construction of the tunnel enter-

prise cannot be doubted, but to argue that these men would deliberately construct the large Upper Rawah Canal at an enormous expense in order that a small part of its waters might possibly be (though never were) conveyed through the Sky Line Ditch, is as unreasonable as the general argument advanced by counsel that all of the labor and painstaking surveys and extensive construction upon the Greeley-Poudre enterprise in the six years beginning with 1902 were without definite plan or object.

It may not be amiss to here suggest that Wallis A. Link, whom counsel for complainant term "a small ranchman" and A. I. Akin, whom they designate merely as "a neighboring farmer," nevertheless were men of enough resourcefulness and creative genius to plan the Greeley-Poudre project. Eminent engineers later made the most exacting surveys to ascertain the best method of constructing this great enterprise, which Professor L. G. Carpenter describes as an "engineering feat worthy of the attention of the best engineering talent," (1405) and each engineer finally approved and accepted the general scheme and plan conceived in the first instance by these two men.

Not only were these men able to plan, but they were equally able to thereafter supervise and direct the early construction upon the project. Engineer Duvall states that all of the extensive work of 1904 was under the direct supervision of Mr. Link, and Mr. Akin continued his intimate relations with the construction of the enterprise from the beginning to the day of the trial.

Nearly all of the great mines of the United States are the discovery of lowly prospectors, many of whom have subsequently become the directing minds in the development of their projects. The continuity of plan, purpose and effort of these two men and their subsequent associates and successors is probably without a parallel in the history of Colorado irrigation enterprises.

It is but natural that junior appropriators should seek, as in this case, to describe initiation and construction of an enterprise such as the Greeley-Poudre over the first six years of its existence as "intermittent" (p. 22) and "desultory" (p. 78), in order that as little credit as possible may be given. The evidence is unanimous in its declaration of the continuity of activity upon the enterprise from 1902 down to 1908, at which time the recent large Wyoming enterprises were first commenced. The activity in Colorado, instead of being "desultory" was directed to the construction of a system on the one general original plan and all the labor and money was expended in order that the system might be completed along the best lines of construction with all possible dispatch.

Before considering the Wyoming appropriations, we suggest:

That the map, Exhibit B, attached to the bill of complaint, is manifestly in error in that no notation of the Upper Rawah Ditch appears thereupon, and, further, in that the courses of the streams and the location of other natural objects are incorrectly noted. We believe that all parties to the record generally admit that the map, Defendants' Exhibit 1, attached to the answer of corporate defendants, is more accurate and complete.

The Laramie River does not rise in the Continental Divide, as stated by counsel (p. 14). On the contrary, the principal tributaries of both the Big Laramie in Colorado and Wyoming and the Little Laramie in Wyoming have their rise in the Medicine Bow range of mountains, which is the range described on page 16 of counsel's brief as having an average elevation of about 10,000 feet, and the record shows that the snow-capped peaks of this range, at the head of the Little Laramie River, are substantially of the same general height and character as those at the head of the Big Laramie in Colorado. Between these two groups, the Medicine Bow range in both states does not attain the elevation that it does at the points mentioned. The Cache la Poudre and North Platte rivers rise in the Continental Divide and the former stream receives part of its water from that portion of the Medicine Bow range between the headwaters of the Laramie and the Continental Divide.

The reservoirs and canal mentioned on page 24 of complainant's brief are described by engineer Hedke (1759-61). The surveys of this reservoir and canal were but collateral to the survey of the general enterprise and were no departure from the original tunnel project. Of these surveys Mr. Hedke, under whose supervision they were made, says:

> "Surveys of Laramie River Reservoir were completed, but it was separate and apart from the system commonly called the 'Greeley-Poudre system.' It was surveyed and mapped as a subsequent and junior enterprise * * * in 1906." (1766.)

Bearing in mind the survey of and extensive construction upon the Greeley-Poudre enterprise subsequent to its initiation on August 25, 1902, and particularly during the years 1903-8, all prior to the initial surveys upon the later Wyoming projects, to which we shall next refer, and that under the rule of priority, if the same were to obtain without regard to state lines, the rights of all junior appropriators from the Laramie River vested subject and inferior to all appropriations theretofore initiated upon the stream, we will now consider diversions from the stream in Wyoming.

IV. WYOMING APPROPRIATIONS.

In considering appropriations of water from the Laramie River in Wyoming, we should first note the contrast of natural conditions surrounding construction in Wyoming with that in Colorado, to give proper credit, under the rule of reasonable diligence, to the efforts of appropriators in the two localities and to prevent undue credit for what might otherwise appear to be speed or rapidity of construction in any one locality.

(1) *The Region.*

It is conceded by all parties to this action that the Laramie Plains have an elevation of from 7,000 to 7,500 feet. The Laramie River portion of the Greeley-Poudre system now in process of construction in Colorado is situate at a much higher elevation.

All the enterprises upon the Laramie Plains here involved (save the inter-mountain Bell Supply Canal No. 2) are within a plains or prairie region, in contrast with the mountain district in Colorado. This Laramie Plains construction consists of mere prairie earth and loose gravel excavation, easy of performance and with longer working seasons in a country so favorably situate, so uniformly smooth, and with so few natural obstacles, that nearly all of the work has been or can be performed with drag-line and steam shovel equipment, the use of which would be impossible in the mountain region of the Greeley-Poudre system. With the possible exception of James Lake, none of these new systems are complete, as erroneously asserted by Wyoming counsel (p. 78, brief).

The ease of construction in the plains region and the difficulty in the mountains is conceded by all witnesses. As stated by Mr. Hedke:

> "A ditch of same capacity on plains as our mountain ditches would cost in the neighborhood of $1,000 per mile. Up in the mountains it would cost $30,000 per mile, and a mile of plains ditches can be built in a matter of several weeks, while a mile in the mountains may take a year, taking nearly all the men you can get on that mile to do it in one season's work." (1777.)

Mr. Sevison, the engineer who made the principal surveys on the Laramie Plains, says:

> "The country between Lake Hattie and the river is very easily surveyed. Most of it is across a tableland that is quite uniform. * * * The ditch follows the line which would be run by a level. There is no tunneling or heavy cutting with but the one exception where

you go through the arm of the bluff. * * * I had an unlimited field in which to work, without any obstacles." (654-5.)

"All work on the main outlet canal, and on the north and south canals, was the ordinary small ditch building,—entirely plain earthwork, no tunnels or rock work or flumes or anything of that sort. *The whole Lake Hattie System was one of remarkably small cost and economical construction.* At no place in the entire system did we encounter any difficult engineering problems." (660.)

The contrasts between the two regions are strikingly drawn in the testimony of witnesses Lyman E. Bishop, the engineer on the Lake Hattie project who succeeded Mr. Sevison (793-6); Professor L. G. Carpenter (1404-5); Engineer John R. Wortham (1619); Engineer Charles R. Hedke (1777-9); Engineer Zac T. Duvall (1895-7); Wallace A. Link (1920-3, 2076-8) and A. A. Edwards, irrigation expert (2239-40.)

The District Court of Larimer County, Colorado, having before it the adjudication of priorities in the Laramie River region in that state, took notice of this contrast between plains and mountain construction and in its decree (Defendants' Exhibit 179), wherein it fixed August 25, 1902 as the priority of the Greeley-Poudre system, says:

"All of the construction involves tunneling and excavation through mountains and along the steep mountain sides on either side of the Laramie Valley, *requiring a greater period of time* in the completion thereof than would be required to complete an enterprise of like proportions situate under and surrounded by ordinary conditions. All supplies, machinery and labor must be transported by teams for a distance of from seventy to one hundred miles, in large part over mountain roads, from either Laramie, Wyoming, or Fort Collins, Colorado, under conditions least favorable to economical transportation.

Owing to the altitude, climatic conditions and geographical location of the system, the working season, during which men may be engaged in other than tunnel construction, and the season of transportation of freight, are limited to a short period of from three to four months out of each year. The remoteness of the works from railroads, towns, cities, and labor centers, makes the obtaining of laborers difficult, and requires payment of high wages and maintenance of expensive accommodations. The construction throughout is of hazardous character, requiring the use of dynamite, powder and

other explosives and the services of a class of laborers hard to obtain and easily dissatisfied. The shortness of the working season requires a total disorganization of the entire laboring force at the close of each year's work and complete reorganization the next succeeding year.

The foregoing and many other obstacles unknown to construction of irrigation works in plains or prairie regions or in regions of better climatic conditions and geographical location, *require longer periods of time than would otherwise be necessary, reasonable diligence being a question of years as compared with months under ordinary conditions.*" (Pages 5 and 6, Exhibit 179.)

In the *Wheatland area* on the east side of the Laramie Mountains or Black Hills, the easterly border of the Laramie Plains, construction is even less difficult than in the Plains region, as the district is of lower altitude with somewhat longer summers and better general working conditions.

---

(2) ADVANCE FINDINGS AND DETERMINATION OF QUESTION OF PRIORITY AND WATER SUPPLY IN WYOMING.

A review of the methods of initiating Wyoming appropriations and the legal effect of the decisions of the State Engineer by granting or refusing permits is essential to a clear understanding of the subject under consideration.

In Wyoming an appropriation is *initiated* by the filing of an application for a permit. This is prerequisite to construction, enlargement or extension of any ditch or diversion system or to performing any work in connection therewith. The state engineer endorses on the application the date of its receipt and notes the same in the records of his office. He then, sitting as a quasi-judicial officer, determines (1) whether or not there is any unappropriated water in the stream which will be available for the proposed project, and (2) whether the proposed use conflicts with existing rights or (3) threatens to prove detrimental to public interest. He has full power to reject the application and thus forbid the appropriator to proceed with the construction of the enterprise.

If the state engineer officially determines *that there is unappropriated water in the stream* from which the proposed diversion is to be made, and *that the proposed use does not conflict with existing rights* (and is not detrimental to public interest), he grants permit for the construction of the enterprise and the appropriator may thereupon (not theretofore) proceed in conformity with the conditions and limitations set forth in the

permit. Priority dates from the filing of the application in the State Engineer's office.

This procedure is in direct contrast with that in Colorado where the appropriator determines for himself whether or not there is unappropriated water and whose filing with the state engineer is a mere record and does not move that officer to detemination of any question in advance of construction. He proceeds to construct as he may be advised and the first official determination of his rights is the decree of the District Court in adjudication proceedings brought for determination of the relative rights of all appropriators from the stream. If the appropriator has used reasonable diligence, his priority is decreed by the Court as of the date of initiation of his appropriation, whether by beginning of survey or commencement of actual construction.

In Colorado all rights of the appropriator are determined after and not before initiation, while in Wyoming the converse is true.

In other words, the State of Wyoming, by and through its quasi-judicial tribunal, the State Engineer, *officially determines certain facts in advance* (1) of permitting any rights of appropriation to attach or (2) any construction to proceed. He officially finds and determines *whether or not there is water to appropriate* and to what degree and in what manner construction may proceed and the law fixes the date of appropriation as the date of the filing of the application for the permit, thereby *also fixing in advance the priority* date of each diversion. This judgment of the state engineer binds the appropriator and the State as well.

On the other hand, in Colorado, experience alone demonstrates whether or not there was unappropriated water in the stream for the enterprise at the time of its initiation and the proof submitted moves the court to the decree which determines the relative priority and extent of each appropriation.

The Wyoming statute was enacted in 1895 and any and all appropriations of water from the Laramie River in that State, during or subsequent to that year, were made only by authority or permit of the state engineer.

Each of these permits were and are quasi-judicial decrees in effect as follows:

(1) That there was ample water supply for all diversions and initiated appropriations from the Laramie River;

(2) That after supplying all such prior appropriations, there remained surplus or unappropriated water in the stream which was available to the new projects;

(3) That the appropriations for which applications were made in no manner interfered with existing appropriations or were detrimental to public interest; and

(4) That all parties granted permits for the Laramie River and tributaries might safely proceed to construct their works to the magnitude and extent set forth in the permits. (3910-19.)

(3) Priority Groups and Natural Classification.

All these appropriations from the Laramie River and tributaries in Wyoming may likewise be considered in three general groups:

(a) Meadow appropriations in the mountain districts near the sources of the Wyoming streams.

(b) Those from the Big and Little Laramie Rivers and other tributaries upon the Laramie Plains, and,

(c) Those east of the Laramie Mountains (Black Hills) and in the Sybille and Chugwater drainage areas.

The Wyoming diversions from the Laramie River fall within two groups or epochs, those prior and those during and subsequent to 1907-8.

We are here considering the priority of the Greeley-Poudre system on the Laramie River in Colorado as compared with the later appropriations in Wyoming, and the discussion is simplified by separating the epochs of the Wyoming appropriations as either prior or subsequent to August 25, 1902 (the date of the Colorado diversion), rather than the year 1908, no new enterprises of any magnitude having been initiated in Wyoming between 1902 and 1907-8.

(a) Meadow Ditches.

The observations under this sub-head of the principal topic, "Appropriations," will here obtain. In other words, the small diversions for the irrigation of meadow lands along the narrow valleys in the mountain districts of both the Big and Little Laramies in Wyoming and Colorado are considered insignificant and offset one another.

(b) Laramie Plains Appropriations.

Within the general priority classification above noted, diversions from the Big and Little Laramie Rivers and other tributaries of the stream in the Laramie Plains region may be further subdivided into three general groups:

Those canals irrigating the river bottoms or first benches along the streams;

Those canals which have been constructed for a long period of years for the irrigation of bench lands, and

The newer enterprises involving the utilization of large natural and artificial reservoirs in process of construction for service of the higher lands of the area.

(b-1) Appropriations Prior to August 25, 1902.

All appropriations within the first two of the last mentioned groups are prior to August 25, 1902, while those in the last group are long subsequent to August 25, 1902, and were generally commenced subsequent to March, 1908, and some of them as late as during 1912, after the filing of this suit.

All of the appropriations initiated upon the Laramie Plains prior to August 25, 1902, had copious supplies of water in considerable part permitted to pass unused after the needs of these earlier canals had been supplied. The State of Wyoming has repeatedly so declared and decreed through its State Engineers by granting permits with new priorities for new enterprises since 1908. So ample has been this supply that no care or supervision of distribution had ever been necessary prior to filing the bill of complaint herein, and all appropriators have been permitted to help themselves to whatever water they chose to divert, even then leaving sufficient in the river to justify the State Engineer in awarding new priorities for new enterprises of great magnitude.

(x) River Bottom Canals.

The earliest irrigation in the region, naturally following the lines of least resistance, was entirely from numerous canals easily constructed for irrigation of the river bottom and first bench lands of the river valley proper (486, 561-2). These canals were constructed for the irrigation of native hay meadows and utilized the water only up to the last of June and never later than July 15th of any year (561-2). Water Commissioner Grant of Wyoming, the first official to ever assume to attempt a careful distribution of water, beginning with the year 1913, testified that a large number of these older ditches are "two story" or "high water" ditches, meaning that at the several points of diversion, the bottoms of such canals are considerably, and in some instances several feet above the bottom of the river, making it physically impossible for the canal to receive water except in times of flood and evidencing the fact that these canals had been constructed and always used for diversion of water from a stream with flow greatly in excess of the demands of all appropriators and not requiring diversion during low flow. A reading of the record will reveal but few declarations to the effect that these canals were ever "short of water," and in each instance the witness admitted that there was ample water in the stream and no difficulty would have been encountered in obtaining sufficient to supply his wants had his canal been properly constructed.

By these smaller canals flood waters are diverted and spread over the meadows in such a manner as to form one con-

tinuous sheet of water, standing upon and to some degree circulating over the land between the canals and the river. This method of irrigation still prevails from the time the canal is opened in the spring until closed in early July to permit the meadows to dry before the hay harvest begins. Doubtless a portion of the water thus diverted returns to the stream and is again used by other appropriators lower down, but that enormous loss occurs through evaporation and that the method is extravagant and wasteful is not seriously questioned.

Among these ditches may be mentioned the several canals used to irrigate the Sodergreen Ranch; the King, Riverside Ditches No. 1 and No. 2; Caldwell and Gardiner, Bush and Holliday, and other canals used for the irrigation of the Riverside Ranch; the Hoge and Haley, Leroy and other ditches used for the irrigation of the Hoge ranch, situate just above the mouth of Sand Creek; the Mansfield Ditch; the Dowling or Bilderbach Ditch, used to overflow a portion of the old Hutton and Hart ranches, and the Oasis canal for the irrigation of meadows belonging to that ranch, all diverting water from the Big Laramie River; the Gillespie, Boughton, Cooper Lake and McGill Ranch ditches on the main Laramie below the confluence of the two principal branches; and the canals for the Millbrook, Alsop and Ernest Ranches, and the other numerous canals used to overflow the broad flood meadows of the Little Laramie region.

This general class of ditches served the greater portion of the acreage under irrigation in Wyoming before the commencement of this suit. After taking their full measure and flooding the Big and Little Laramie valleys with one continuous sheet of water, there still remained ample water to warrant the construction of newer canals for irrigation of higher lands and it is unnecessary to enter the maze of a minute discussion of the list of these many early diversions, as the subsequent diversions in Wyoming, but prior to 1902, not to mention diversions in Colorado as of that date, have no appreciable effect upon the water supply of these river bottom canals.

(*y*) *Early Bench Land Canals.*

The second stage of earlier Wyoming development is evidenced by construction of canals for irrigation of bench lands arising above the river valley proper. These canals are larger but are likewise used primarily for irrigation of native hay land, with methods generally the same as those prevailing under the river valley ditches (866-7.) Practically none of the water from these larger canals returns to the stream, owing to the geological formation of the area, but flows or seeps into depressions, ponds and water-logged areas and in many instances is run

for long periods of time into lakes and depressions having no outlet and, in one instance, with bottom more than one hundred feet below the bed of the river. From these ponds, immense depressions and water-logged areas, the only escape for the accumulated water is by evaporation (489, 2739.)

The superintendent of the Pioneer Canal states that it has been his custom for long years to run from 50 to 60 cubic feet of water in the canal continuously from July 15 to December of each year for the sole purpose of supplying drinking water to about 2,000 head of cattle, running at large in that vicinity, and a few of the 250 people residing under the canal. One cubic foot per second delivers two acre feet every twenty-four hours, and it accordingly appears that it has been the custom of the Pioneer Canal management to run to waste 100 acre feet per day for 150 days (15,000 acre feet annually), in order to furnish drinking water for a few people and cattle in a region already filled with lakes and ponds. The witness states:

> "The people and stock and seepage and evaporation consumed this 50 second feet running constantly. Very little water went back to the river or into the numerous lakes." (See Titus, 967-70.)

The same characteristics of diversion, use and waste apply to all these earlier bench land ditches, including those on the Little Laramie River. Some of these ditches are of considerable size and waste into ponds from which there is no outlet or opportunity of re-use of water for irrigation. The Poverty Flat and Park ditches both waste into Big Basin, a large alkali lake, the bottom of which is from 75 to 100 feet lower than the level of either the Big or Little Laramie Rivers in that vicinity. (2741.) During December, 1913, water was flowing through both the Poverty Flat and Park Ditches to about three-fourths of their capacity, and wasting into Big Basin under guise of so-called "domestic use," in this, one of the dryest seasons experienced in the Laramie Plains region (2742.)

Among these larger canals, so constructed and utilized for diversion of water for some irrigation and great waste, may be mentioned the Pioneer Canal, Fischer, Last Chance and Parker ditches, diverting water from the Big Laramie River near Wood's Landing, some 75 miles (547) by river meander below the Greeley-Poudre tunnel (486-8, 492), and the Loback, Bellamy, Millbrook, Hecht, Hecht and Farrell, Poverty Flat and Park canals from the Little Laramie River.

The Pioneer Canal is alleged to have served as high as 18,000 acres during 1902 (863), but so unprofitable was the attempted agriculture under the canal that the acreage served in 1913 had fallen away to 11,556 acres (844) and but 250 people resided within the area served by it and the other men-

tioned canals diverting water from the Big Laramie River (872.)

This Pioneer Canal is alleged to have been constructed in 1879 or 1880. Its opportunity of diversion has been so unlimited that it has not only poured its copious supply over its grass lands and filled its waste lakes and ponds for annual loss by evaporation, but, in addition thereto, it has been permitted, without protest, to divert and waste annually 15,000 acre feet of the ample supply of water in the Laramie River after all necessity of irrigation in the region had passed. The decided contrast between this canal with its copious supply and prodigal diversions of water and the Larimer & Weld Canal (Eaton Ditch) in the Cache la Poudre Valley can best be comprehended by inspection of the albums of photographs taken within the two areas and introduced in evidence as Defendants' Exhibits 115, 116 and 120. See also photo albums, Defendants' Exhibits 119, 122. The more striking becomes the contrast when it is observed that the history of the Larimer & Weld canal has been one continuous contest for but a part of the water supply required to reclaim its lands, upon a stream administered under most rigid police supervision by river commissioners, as compared with the copious supply of the Pioneer Canal whose diversions have always been made without supervision or restraint, either in point of time, quantity or duration.

The above mentioned canals, diverting water from the Little Laramie River, have received as copious supplies as have the canals from the Big Laramie, and the enormous waste from all these diversions verifies the judgment of the State Engineer of Wyoming in declaring, by granting additional permits, that ample water is available for appropriation and diversion after the demands and claims of *all* prior appropriators have been supplied.

During 1913 a careful plane table survey of nearly all the irrigated lands in the Laramie Plains region (with the exception of some distance below the confluence of the Big and Little Laramie Rivers at Two Rivers) was made for defendants by an engineering party under the direction of the State Engineer of Colorado and the immediate supervision of his deputies, Engineers McAnelly and Woodhall. This survey occupied the entire summer season of that year, and its detailed accuracy is evidenced by defendants' Exhibit 114. A hasty reconnaissance, without instruments, was made of the same areas by the Laramie Water Company's surveyor, R. I. Meeker, with fairly confirmatory results. The lands served by the new enterprises initiated during 1908 and subsequently were likewise included in the totals of the acreage thus compiled.

This careful investigation reveals the fact that during 1913 there were but 78,999 acres of land irrigated from the

Laramie River and its tributaries in the Laramie Plains region, consisting of the lands served from the Little Laramie and its tributaries, and by canals diverting from the Big Laramie and its tributaries, and also from the main stream below Two Rivers and above Wheatland Reservoir (2790-1.)

The greater portion of this acreage was under irrigation and served by the old canals before initiation of either the Greeley-Poudre project in Colorado or the new Wyoming projects which we will later consider.

The granting of recent permits by the several State Engineers of Wyoming and the coincident decree that there was water supply in the stream, the large flow of the rivers as shown by the hydrographic data compiled by experts Prof. L. G. Carpenter, John E. Field and others, and the history of the entire Wyoming irrigated acreage as given by its own witnesses, are sufficient to justify us in concluding that the Greeley-Poudre enterprise, with its comparatively small diversion of but a part of the flow of the Colorado portion of the stream can work no substantial injury upon or interference with these older appropriations, the unnecessary and prodigious waste from which more than equals the sum total of the Colorado diversions. We will therefore pass all these older Wyoming canals without further consideration and will confine our discussion to the more recent enterprises, all of which were initiated long subsequent to the Greeley-Poudre system in Colorado, but which stand as accepted and approved appropriations within her borders by the complainant, State of Wyoming.

(*b-2*) *Appropriations Subsequent to August 25, 1902.*

The third and last group of the Laramie Plains diversions primarily includes several large reservoir enterprises. This period constitutes the third and last stage of Laramie Plains construction. It is the epoch of reservoir building. Following construction of the older canals, there was no important irrigation development on the Laramie Plains until about 1908. Prior to that year the region had contented itself with its existing diversions, carried on without the slightest supervision and with ample water both for use and waste.

During the spring of 1908, the Arnold Engineering Company of Chicago entered the field and commenced a series of surveys and at about the same time others of speculative tendencies undertook the promotion of new enterprises. The efforts of this engineering concern and those other parties whose activities were evidently awakened by its entry into the field, by various processes of consolidation, later took the form of two new systems, commonly known as the James Lake or Talmadge-Buntin system, and Lake Hattie or Laramie Water Company's system.

One small private enterprise was initiated immediately prior to the James Lake and Lake Hattie projects, and is known as the:

(m) Sodergreen High Line.

In November, 1907 (445), Oscar Sodergreen commenced the survey of a canal from the Big Laramie River at his ranch near Woods Landing at the upper extremity of the Laramie Plains. On December 27, 1907, he filed application for permit for the Sodergreen High Line Canal, and on April 14, 1908, it was approved by the State Engineer of Wyoming with priority as of December 27, 1907, and granted permit No. 8328. Construction was completed during 1910 (3962, 418, 445). The canal was constructed by Sodergreen for native hay irrigation on about 3,400 acres (2790), and was used without supervision and at its owners' will during the season of 1911 and 1912, and up to July 1, 1913. (446.)

No claim for earlier priority is made on behalf of the canal. Irrigation of native hay ceases with the close of the flood flow in the latter part of June and the early part of July of each year. This fact, coupled with the small acreage to be served, justifies passing this canal without further consideration.

(n) Lake James System.

The Seven Mile Creek drainage lies immediately adjacent to and north of the Little Laramie River. The creek flows down the Medicine Bow Mountains and, after serving a small acreage of meadow land in its valley, of nature discharges its waters into James Lake, a natural basin with no outlet save in exceptional years when the same overflowed and discharged into the Laramie River through the water course of Four Mile Creek, the next adjacent stream. It required the mere excavation of a cut through a narrow earth rim and installation of outlet works to convert this large natural body of water into an active storage reservoir. It is to a large degree filled with corresponding ease from the Little Laramie by extension and enlargement of the old Bellamy Canal, and naturally serves a large acreage easy of access by ditches constructed upon the open plains. The self-evident ease and economy with which the entire enterprise could be promoted and constructed, along with the equally available Lake Hattie Reservoir system which we shall hereafter consider, naturally appealed to eastern parties seeking opportunities of promotion, and accordingly Trowbridge and Niver of Chicago sent The Arnold Engineering Company into the field during the spring of 1908 and initiated the first and

initial surveys looking toward the ultimate construction of the scheme. (650.)

March 22, 1908, Z. E. Sevison, engineer for The Arnold Engineering Company, commenced survey on the James Lake project for utilization of the basin as a storage reservoir for water from Seven Mile Creek and also from the Little Laramie through an extension and enlargement of the Bellamy Canal. (638.) Wyoming admits that "the original surveys for the project were commenced on March 22, 1908," on page 75 of her brief. This admission, in turn, of necessity admits that all work by Sevison and his successors was junior to this date, as we shall hereafter observe. In due course, these efforts of Mr. Sevison were followed by filing of applications for permits for leave to construct the enterprise and praying investigation and approval of the water supply by the State Engineer of Wyoming. These applications were filed in the name of G. S. Speer of Chicago, having to do with the financial part of the project and in some way connected with Trowbridge & Niver, a brokerage concern promoting and selling irrigation district bonds in that city. (651.) In due course, the State Engineer of Wyoming adjudged that there was ample supply in Seven Mile Creek and the Little Laramie River, after supplying all prior diversions, to warrant the granting of permits, and accordingly, during May, 1908, issued permits Nos. 8385-9, and 1279 Reservoir to G. S. Speer, authorizing the construction of the James Lake system as of priority dates March 27, April 23, and May 1, 1908. (3962.)

On February 20, 1909, the State Engineer granted further permit No. 1872 Enl. to G. S. Speer to divert the water of Four Mile Creek into James Lake Reservoir, as of priority dated February 17, 1909.

Following the granting of the above permits, the Laramie Valley Irrigation District, commonly known as the "Talmadge-Buntin District," was promoted by Talmadge and Buntin (594-5, 631) with the idea of including in one project the river bottom lands on the east side of the main Laramie River below Two Rivers, theretofore served by the old Oasis Canal diverting water from the Big Laramie River, along with the new lands available for service by the outlet canals to be constructed from the James Lake Reservoir. This district was surveyed as a part of the general project by Mr. Sevison during the earlier part of 1908. (608-9.) He made a topographic survey of the lands under the Oasis Ditch as well as those under the old Cooper Lake Ditch which were likewise absorbed into the general scheme. (619-22.)

Construction followed survey and general organization of

the scheme. The old Bellamy Canal was enlarged and extended to fill the reservoir from the Little Laramie River, and the reservoir was constructed to a capacity of 41,100 acre feet. (632.) The outlet canals were constructed. The feeder ditch from the river to the reservoir was not completed until 1911, but was sufficiently complete to turn some water through during 1909. (634.) About 18,000 acre feet of water were stored in the reservoir during 1909 and about 10,000 acre feet in 1910. (635.) About 30,000 acres of land were included in the project on the west side of the river and intended for irrigation from the reservoir. (543.) During 1909 many settlers occupied a portion of the land, but in 1912 there were only about half as many settlers under the project as there were in 1909 (644), and in 1913 only a small portion of the land theretofore plowed was in cultivation and the whole project was practically abandoned, although there was ample water for their irrigation.

Subsequent to the original permits, the State Engineer issued further and additional permits, Nos. 8874, 1971-2 Enl., and 2325-6 Enl., from the Big Laramie River through the old Oasis Canal and from the Little Laramie River by way of the Bellamy and James No. 1 Canal. These permits were issued to The James Lake Irrigation Company, the successor of G. S. Speer, the original promoter, and have priority dates as of May 6 and November 24, 1908, and November 19, 1910. (See Table 3962, p. 1174 Abstract.)

All of construction authorized under these permits was certified and recorded as completed in the office of the State Engineer during the years 1909 to 1912, inclusive. (3962.)

A close analysis of the priorities of the project requires a consideration of each of the aforementioned permits with its respective priority date, but for convenience we shall treat the entire project as entitled to priority of date of beginning of the initial survey, March 22, 1908, rather than March 27, 1908, the date of filing of the first application for permit, for better comparison with the Colorado priorities, which date as of the commencement of survey or construction, which method we shall likewise follow in dealing with the many other surveys which we will hereinafter consider.

Of all the new projects constructed in Wyoming, the James Lake System probably involved the least expenditure of time, labor and money. The natural reservoir needed but little work to convert it into an immense storage basin, while all excavation was of mere prairie earth, and easy of access to a trans-continental railroad.

Almost six years from August 25, 1902, had elapsed before the Trowbridge & Niver brokerage and promotion company of Chicago caused The Arnold Engineering Company to send Mr.

Sevison into the Laramie Plains to begin his survey of the James Lake enterprise (also Lake Hattie system). This survey commenced on March 22, 1908, was of the same initial character as that commenced by Engineer Beach on August 2d, 1902 on the Greeley-Poudre system, and in no part of the record is there any assertion that any previous survey of the James Lake system had ever been made or even contemplated, but, on the contrary, Mr. Sevison asserts that he went upon the enterprise under exclusive direction of the foreign promoters then entering a new field for the purpose of initiating, planning, promoting and constructing this and the other enterprise.

This was the first and earliest of all the new reservoir projects upon the Laramie Plains. The Lake Hattie Reservoir follows immediately thereafter with others still later, but with the initial survey on March 22, 1908, the new epoch of construction opened within this region, and not before.

(*o*) *Laramie Water Company or Lake Hattie System.*

Trowbridge and Niver of Chicago, not content with the promotion of the Lake James enterprise, included the greater part of what is now called the Lake Hattie system in their field of investigation and promotion during the spring of 1908.

This work was likewise placed in the hands of the Arnold Engineering Company of Chicago, and under the immediate direction of Engineer Z. E. Sevison, who says:

> "From March 22, 1908, until September 1, 1909, I was resident engineer for the Arnold Company on all their work here," (referring to the Laramie Plains) "including the James Lake project and the Lake Hattie Project." (605.)

Mr. Sevison performed the initial engineering upon the Lake Hattie system, now owned by the Laramie Water Company. (645).

April 16, 1908, he commenced the first survey. To use his own words:

> *"Began* the work *April 16, 1908;* surveyed first Lake Hattie Reservoir, then the intake canal from the Laramie River" (referring to Big Laramie) "also preliminary surveys for outlet canals and distribution system. These surveys continued with slight interruptions for a little over a year. The final location of the canals was started about May 1, 1909." (646.)

Further, concerning this initial work on the Lake Hattie system, he said:

"At the time I began these surveys, on April 16, 1908, I was working for the Arnold Engineering Company. Mr. Rosecrans instructed me to start. He was chief engineer for the Arnold Company. I was in Laramie when I received the order, where I have been since March, 1908.

This project was surveyed by the same field party that surveyed James Lake. We shifted back and forth from one project to another. This preliminary work was under my immediate supervision. I know a man by the name of G. S. Speer. He was from Chicago. He had something to do with the financial part of the project.

The Arnold Engineering Company was doing this work up to about the first of June, 1908, for Trowbridge and Niver of Chicago." (651.)

Of procedure, he said:

"The *first survey* was made *at* the *reservoir site* to see if it was feasible. * * * My work was largely preliminary work on the Lake Hattie Reservoir; work that is usual on any project of any size. My time was taken up with that instead of final contouring and similar work." (653.)

"*After* I had worked *on the reservoir* I went over to work on the *inlet canal,* being the canal from the Big Laramie River to the reservoir. I moved my party over to go to work on the inlet ditch a week afterwards. I was 4 days in locating the lower or final line as the feasible one.

The country between Lake Hattie and the river is very easily surveyed. Most of it is across a table land that is quite uniform. * * * The ditch follows the line which would be run by a level. * * * I had an unlimited field in which to work, without any obstacles." (654.)

"The final location and line was made in May, 1909. At that time I staked out all these final lines." (658.)

As indicative of the fact that this whole survey was a matter of first impression, Mr. Sevison says:

"No old maps were given me that I followed and no old surveys." (661.)

The Lake Hattie and the Lake James projects are quite similar. As Mr. Sevison stated, the country between the river

and Lake Hattie is mere level prairie, very easily surveyed, and the ditch was surveyed along the line naturally run by a level, requiring no tunneling or heavy cutting and giving an unlimited field in which to work without any natural obstacles. The lower end of the inlet was constructed by merely running water through a small ditch which naturally eroded into the ground. All of other inlet ditch excavation was done with a "drag-line" at the low price of thirteen cents per cubic yard. (654-5). In this drag-line work, the dirt was deposited on both the upper and lower sides of the ditch which was made by simply cutting across the flat prairie. (457).

The dam at Lake Hattie was made from earth borrowed in the vicinity of the structure. It is a short dam of only 36 feet maximum height and required the placing of only 180,000 cubic yards of earth. (658).

Of work on the outlet ditch, he says:

> "All work on the main outlet canal, and on the north and south canals, was the ordinary small ditch building,—entirely plain earthwork, no tunnels or rock work or flumes or anything of that sort." (660.)

Mr. Sevison concludes his description of the character of construction as follows:

> "The whole Lake Hattie system was one of remarkably small cost and economical construction." (660.)

As Mr. Sevison proceeded with his work of initial surveys upon this Lake Hattie project, he recorded his findings, thus of first impression, by filing with the State Engineer of Wyoming applications for permit for each unit as he proceeded. These were in the name of G. S. Speer of Chicago (Trowbridge and Niver) as claimant, but under the certificate of Mr. Sevison.

The first and initial application was filed April 21, 1908, and is entitled "Map of Lake Hattie Reservoir and Supply Canal." (Defendants' Exhibit 159.)

The second was filed May 11, 1908, for an appropriation by the Lake Hattie Reservoir through the supply canal described in the filing of April 21, 1908. (Defendants' Exhibit 162.)

On September 11, 1908, application was made for the outlet canal system from Lake Hattie. (Defendants' Exhibit 161.)

And again, on September 18, 1908, the progress and enlargement of the surveys of Lake Hattie as first conceived in April of that year was evidenced by filing application for permit for a much larger reservoir, entitled "Enlargement of Lake Hattie Reservoir," wherein all rights claimed by the earlier April and May filings for smaller Lake Hattie Reservoir were included

by reference. (Defendants' Exhibits 163-164; see also Exhibit 165.)

With each of these applications is appended a map and plat prepared and certified to by Mr. Z. E. Sevison, wherein he certifies that the first map (Lake Hattie Reservoir, Exhibit 159) was made from notes taken during the actual survey, *beginning April 16, 1908*, and the last by surveys made on September 10-12, 1908.

For convenience of the court, these and all other exhibits concerning the Lake Hattie System have been photographed and bound in a volume as a part of the record, and the general expansion of the ideas of Engineer Sevison as he worked through the summer of 1908, following his initial surveys in April, is best observed by inspection of the maps attached to these exhibits.

Mr. Sevison finally filed his map of the Lake Hattie Reservoir on final survey made June 1, 1909, in behalf of "The Lake Hattie Reservoir & Irrigation Company" by him as engineer for The Arnold Company of Chicago. This map speaks for itself. (Defendants' Exhibit 165, part 1.)

Mr. Sevison states that he also made a preliminary survey of the Boswell or Robertson-McConnell Reservoir in June, 1908 (evidently intending to state October 26, 1909, see certificate, part 1, Exhibit 177), for the purpose of checking the possibility of the construction of a dam at the upper end of the canon which the Big Laramie enters immediately after leaving the interstate line, and to ascertain the possibility of utilizing the waters thus conserved through the Lake Hattie System.

(647.) He, however, says of this survey:

> "The work of construction has never commenced on it, other than mere survey." (663.)

Nothing was done toward claiming any rights for the Boswell or Robertson-McConnell Reservoir at that time and it was treated with indifference until minds of still greater promotive imagination came to have control of the project. In fact, there is no evidence that anything but a mere investigation of the dam site was made by Mr. Sevison under direction of the original promoters. Subsequent parties, however, did apparently enter upon a survey and we find them filing application for a permit during 1911. (Defendants' Exhibit 177.) This application, however, was made by one H. M. Hedges and in the certificate attached to part 1 of Exhibit 177, he certifies:

> "On January 10, 1911, I made surveys verifying this map and the statements thereon and they are correct of my own knowledge; that I am the locating engineer em-

ployed by the Laramie Water Company, the applicant herein."

This permit was granted on January 24, 1911, but nothing further came of the whole scheme save that it stands as a permitted claim upon the stream, decreeing on behalf of Wyoming that an ample water supply exists to fill it after supplying all prior appropriations, and that no prior appropriators on the Laramie River would be injured by its construction. We shall treat further of this reservoir.

The entry into the field of the engineering party sent out by the Chicago promoters evidenced the possibility of profits to those undertaking construction of projects such as Lake Hattie and Lake James. This set in motion and aroused the cupidity of other promoters desiring equal opportunity for handsome profits at small initial expense, and we witness the entry of E. J. Bell, Francis C. Grable and F. S. Wendelkin of the Rocky Mountain region in the several capacities and under the names we shall hereafter mention.

These promoters on June 29, 1908, filed their first and initial application for permit for the Stewart Canal to divert water from the Little Laramie River, wherein their engineer, C. C. Carlisle, certifies that he *commenced his survey on June 22, 1908.* (See map, Defendants' Exhibit 170.)

In rapid succession thereafter these new promoters, operating in the name of E. J. Bell and The Interstate Reservoirs and Construction Company, recorded the several epochs of the expansion of their ideas by filing applications as follows: July 6, 1908, Bell Supply Ditch No. 2, for the diversion of water over the divide from Douglass Creek of the North Platte drainage into the head-waters of the Little Laramie of Laramie River drainage, upon surveys initiated June 26, 1908 (Defendants Exhibit 173); July 19, 1908, for the Bell Reservoir (never constructed) for storage of water from the Little Laramie River through Bell Supply Ditch No. 1, and predicated upon surveys certified to begin June 2, 1908. (See Defendants' Exhibit 168, and map with engineer's certificate.)

These parties also included the Bath Reservoir, for which survey, according to the application for permit filed September 15, 1909 (Defendants' Exhibit 171), was commenced by the Interstate people *August 30, 1909.* Permit to construct was granted by the State Engineer August 11, 1910, for construction of a reservoir with an authorized capacity of 37,604 acre feet to be filled from the Little Laramie River. No construction work has ever been done.

Interlocked with the promotion upon the Little Laramie, The Interstate Reservoirs and Construction Company (Bishop, 797) projected a scheme for irrigation of lands from the Big

Laramie River. In 1910 this company filed application for permit for the Interstate Canal No. 2 (Defendants' Exhibit 176) to divert water from the Big Laramie River for the irrigation of 22,544 acres. This application purported to be based upon surveys made by one W. B. Schilling *commencing July 1st, 1910,* and the map accompanying the same shows an intent to reclaim lands on the south side of the Laramie River in the vicinity of Hutton and Creighton Lakes.

No action was taken upon this permit by the state engineer until the 28th day of January, 1911, and in granting the same he classes the same as an appropriation secondary to the Robertson-McConnell Reservoir, which, in the interim, had come into title of The Laramie Water Company.

The same Interstate Reservoirs and Construction Company on December 12, 1910, filed its application for permit for the Sand Creek Diversion Canal for the purpose of diverting water from Sand Creek and conveying and discharging the same into the Interstate Canal No. 2 as an additional source of supply. This permit was likewise held without action by the state engineer until January 28, 1911, when the same was granted as supplemental to the permit No. 10364 for the Interstate Canal No. 2.

It will thus be observed that the entire recent Laramie Plains development had its initiation with the coming of the survey party from the office of The Arnold Engineering Company in Chicago at the instigation of the irrigation bond brokerage house of Trowbridge and Niver of that city in March, 1908, and that the *first survey to be made commenced March 22, 1908,* upon the Lake James Reservoir; that the *next survey initiated* by The Arnold Company was *on April 16, 1908,* upon the Lake Hattie Reservoir. This in turn was followed by initiation of the Little Laramie development by the E. J. Bell claims and applications for permit predicated entirely upon surveys the earliest of which began on *June 22, 1908* (Stewart Canal), and lastly parties interlocked with the Little Laramie development still expanding their ideas, filed applications for development of land on the south border of the Laramie Plains and south of the Big Laramie River, predicated upon surveys alleged to have been first commenced *July 1st, 1910.*

In the interim between the March and April, 1908 work upon the Lake James and Lake Hattie systems by Engineer Sevison for the Chicago promoters, and the filing of the claims by The Interstate Reservoirs Construction Company last above mentioned, the Lake James and Lake Hattie projects passed from the Trowbridge and Niver concern. The Lake Hattie system passed into the control of The Lake Hattie Reservoirs and Irrigation Company, headed by Mr. George Rebertson of

Shamokin, Pennsylvania, and Senator McConnell of Shamokin, who was also interested in the Company. (665, 799.)

It should here be noted that Messrs. Robertson and McConnell of Shamokin, Pennsylvania, had no interest in this project until long after the initial surveys in March and April, 1908, and that they are apparently the gentlemen after whom the Robertson-McConnell Reservoir is named, giving evidence of the fact that that structure was really initiated for the first time after the arrival of these gentlemen as members of the holding concern.

By the beginning of 1910 the James Lake project had divorced itself from the original Chicago promoters, termed by Engineer Bishop for Wyoming "the ring connected with Trowbridge and Niver of Chicago." (799.) The lands had been formed into the Laramie Valley Irrigation District or "Talmadge-Buntin" project and the construction work had been largely completed under an entirely different management from that which assumed control of the Lake Hattie and other projects. (631-4.)

The Lake Hattie system had also passed from the "ring connected with Trowbridge and Niver" headed by G. S. Speer, into the control of The Lake Hattie Reservoir and Irrigation Company.

E. J. Bell, Francis C. Grable and F. S. Wendelkin and their company, The Interstate Reservoirs Construction Company, were still in control of the Little Laramie schemes, including the inter-watershed diversion from Douglas Creek of the North Platte drainage and also of the Interstate Canal No. 2 scheme for the diversion of water from the Big Laramie River, all of which were as yet mere surveys and imaginary projects upon which no construction had been done.

Some work had been done upon the Lake Hattie Reservoir project, but, taken as a whole, all but the James Lake project were still in embryonic condition.

The old Pioneer Canal, as we have previously observed, had been in operation for a great many years and had brought under reclamation, and in a considerable measure water-logged and ruined, a large portion of the irrigable lands beneath its line by prodigal use of water plentifully obtained without stint or supervision from the Laramie River and copiously supplied, even to the extent of imaginary consumption by animals and men of enough water to annually cover 15,000 acres with water one foot deep, at times when no need of diversion existed. This canal was located at the upper portion of the Laramie Plains where the Laramie River emerges from the mountains and at the point of least resistance for canal construction. It followed at the foot of the mountains that here arise almost abruptly from the Laramie Plains and formed a natural site

for canal line for diversion of water of the Big Laramie for irrigation of that portion of the Plains lying between the Big and Little Laramie Rivers. (940.)

When the Arnold Company sent their engineering party out from Chicago to reconnoiter and locate promotion schemes for the Trowbridge and Niver concern in the early part of 1908, Mr. Sevison, their local directing engineer, then entirely new to the territory and working entirely on first impressions, in seeking the best location for the canal to fill the Lake Hattie with waters from the Big Laramie, ran three preliminary lines and found that the old Pioneer Canal occupied the most strategic position for use, by enlargement, with the new project. (652.)

At that time the Chicago promotion "ring" had absolutely nothing whatever to do with the Pioneer Canal, but Mr. Sevison found that it would be more economical to enlarge the Pioneer Canal for only a short distance in the upper part of its course as the upper part of the new inlet for the new Lake Hattie scheme "provided satisfactory arrangements could be made for the use of the Pioneer to Sodergreen Lake." (652.) The old Pioneer Canal then had the capacity of about 300 cubic feet per second (656) and it was necessary to enlarge the upper portion in order that the use of the canal for service of its own lands should in no way be interfered with.

In May, 1909, the then promoters of the Lake Hattie project concluded an arrangement with the Pioneer Canal Company for the purpose of purchasing its remaining stock and interests in order that it might have control of the old Pioneer Canal for purpose of enlargement. (922.) That portion of the old Pioneer Canal south and west of Sodergreen Reservoir was relocated for about a mile in length and the enlargement began on July 17, 1909. (656, 646.) The old Pioneer Canal was here straightened and given a better alignment and was made larger by widening and excavating to the upper side, the old and lower embankment being left in place. By using the materials so borrowed from the upper side of the canal for raising of the lower embankment, and by the widening of the canal, the capacity was increased so that the new structure, so first conceived by Mr. Sevison in his 1908 surveys, was finally completed to a capacity of about 1,200 cubic feet per second. The canal was in no way disturbed beyond Sodergreen Lake (See Defendants' Exhibit 1) from which point the new canal branched off and ran northwesterly to the Lake Hattie Reservoir and at Sodergreen Lake bifurcation or division works were installed so that water pertinent to the new 1908-9 scheme could be segregated from the commingled waters belonging to the old Pioneer Canal appropriation and the latter carried in its old channel for distribution to its old water consumers. (656-7.)

During 1910 a general combination was conceived of all the embryonic enterprises upon the Laramie Plains, with the exception of the theretofore divorced James Lake project. Up to that time the work of The Interstate Company had been largely engineering. This general merger took form under the supervision of one Goldsborough, an engineer who had recently arrived from the East, and who operated under the name of The Goldsborough Engineering Company. Engineer Lyman E. Bishop was placed in charge as resident engineer on July 1, 1910.

On July 1, 1910, construction work had been done on the enlargement of the upper end of the old Pioneer Ditch, but none on the diversion works in the Big Laramie; the new canal from the point of departure from the old canal at Sodergreen Lake had been partly completed and some work had been done on the dam and outlet canal of Lake Hattie Reservoir. (776.)

The Interstate Reservoirs and Construction Company still controlled the original filings and permits for the entire Little Laramie system, under direction of E. J. Bell, one of its moving factors, and had charge of the proposed Interstate Canal No. 2, in which scheme Francis C. Grable and F. C. Wendelkin were prominent. (Bishop, 797-9.) Nothing but mere pretense of so-called "assessment work" had been in any way performed by the Interstate group of promoters upon any portion of their several schemes. Desultory efforts had been given to promotion and engineering (799) and the Lake Hattie project had not assumed its permanent form and its plans were still in a large measure incomplete, no diversion having been planned, much less surveyed, from the Little Laramie River, and no surveys had been made save merely for the reservoir and a part of its outlet canals, and the new inlet from the Big Laramie, only a part of which had been constructed.

From July 1 to December 1, 1910, small and insignificant, miscellaneous surveys were carried on by The Lake Hattie Reservoirs and Irrigation Company, successors to the Trowbridge and Niver concern, under the direction of Mr. Bishop (777), and included a new canal from the Little Laramie River, which we will next consider.

December 1, 1910, the Lake Hattie system, theretofore contemplating merely the use of the Lake Hattie Reservoir for storage and distribution of waters to be diverted by a new inlet canal directly from the Big Laramie River, was merged with The Interstate Reservoirs and Construction Company and the E. J. Bell promotion schemes, the merger taking form under the name of The Laramie Water Company, which has ever since continued as the owner thereof. (778.)

Beginning with December 1, 1910, the Goldsborough Company assumed active control of engineering of all the many units of the general combined scheme and in addition laid out new units not previously contemplated by any of the various promoters. An application for permit was filed *December 5, 1910* (Defendants' Exhibit 166), for an *inlet canal for Lake Hattie Reservoir from the Little Laramie River,* known as Lake Hattie Supply Canal No. 2.

Lyman E. Bishop, engineer for the Goldsborough Company, states that he located this Lake Hattie Supply Canal No. 2 in August, 1911 (774). Upon the map accompanying the application for permit for said canal, the certificate of the surveyor states that the surveys were commenced July, 1910, which would be the earliest date for which claim of initial survey could possibly be made for this Little Laramie diversion for the Lake Hattie system.

The Laramie Water Company also acquired whatever stock its predecessors had held in the old Pioneer Canal Company, so that this new company secured control of practically all the principal irrigation between the Big and Little Laramie rivers, combining all schemes of every promoter, entering the region since 1908, into one general scheme. It then proceeded under direction of the Goldsborough Company to continue with some of its new construction upon some portions of the project, noticeably completion of the new inlet and outlet canals and dam of the Lake Hattie Reservoir; construction of Lake Hattie Supply Canal No. 2 so first surveyed in July, 1910, and some work upon Stewart Canal and Bell Supply Canal No. 2. All of the remainder of the many units included in the general merger were permitted to lie dormant in the form of mere surveyed lines.

In addition, however, the company proceeded to survey Bell Reservoir No. 3, contemplated for construction across the channel of the Little Laramie River, making application for permit December 5, 1910, and accompanying the same with plats (Defendants' Exhibit 172), wherein the engineer certifies that the surveys were *commenced September 4, 1910.* Permit was granted by the State Engineer of Wyoming, January 25, 1911, for the construction of the reservoir with capacity of 5,121,988,144 cubic feet to be filled from the Little Laramie River. No actual work was ever done upon this project, and, while incomplete, it nevertheless remains an adjudicated right to divert as of priority of 1910 from the Little Laramie River to the extent of its capacity and a proclamation that there still existed sufficient unappropriated water to fill the same.

On May 12, 1912, long after the filing of this suit, and while the adjudication for priorities for water rights was going on before the District Court of Larimer County, Colorado, at Fort

Collins, and the testimony in the case was being prepared, The Laramie Water Company began the survey of a new lateral from their new Lake Hattie Supply Canal No. 1, leaving that canal just above the point of discharge into Lake Hattie and continuing on around the Reservoir basin on a grade line. This new lateral they designated as the "Pioneer Highline," and, in the language of Lyman E. Bishop, the engineer who made the initial survey, "was made for the purpose of serving land immediately north of Lake Hattie Reservoir and all the land in Big Hollow and land on the south limb of Big Hollow, which is above the north canal." (796.) The line of this canal intercepts and crosses the Lake Hattie Supply Canal No. 2. (785-795.)

Application for permit was filed July 11, 1912, and was accompanied by a map. (Exhibit 160.) By the terms of this application it was guaranteed and assured that this new line of canal, if ever constructed at all, would be no additional draft upon the river, but would simply aid in the distribution of water theretofore appropriated by various permits granted the several predecessors of The Laramie Water Company, none of which had ever displayed any reference by maps, words or figures to any such a scheme as this so-called "Pioneer Highline." In the application they specifically limit themselves in the following language:

> "It is understood that nothing contained in this permit shall be construed as meaning the additional appropriation of any amount of water in excess of the total amount of water covered by permits heretofore issued as a part of the Laramie Water Company's system."

We shall give thorough consideration to this mythical canal in answering portions of the brief and argument for the plaintiff State of Wyoming, and, at present, let it suffice to say that no construction and no activity, other than mere survey and filing of the permit, have ever taken place upon the canal. The evident purpose of its survey and filing as an after-thought becomes more apparent on thorough consideration.

At the taking of testimony, 1913, the Lake Hattie Reservoir and its inlet from the Little Laramie River, Lake Hattie Canal No. 2, had been completed, while the enlargement of the extreme upper portion of the old Pioneer Canal, and Lake Hattie Supply Canal No. 1, carrying water from the enlargement of the old Pioneer to the reservoir, had not been fully completed, but had been used for the diversion and carriage of water since July, 1911. The main outlet canal, with its two branches, for the reservoir, had been completed (779), the intermountain diversion from the North Platte to the Little Laramie, known as Bell Supply No. 2, was but 15% complete, and the excavation on the Stewart Canal was only about two-thirds

complete. Other than this, all the rest of the units so merged into the general scheme of The Laramie Water Company had remained dormant and with no construction upon any of them.

The many separate permitted appropriations of water from the Big and Little Laramie rivers, combined and merged under The Laramie Water Company, *all dating of and subsequent to April 21, 1908*, were enumerated by R. I. Meeker, an employee of The Laramie Water Company. Upon request, he produced all these permits for inspection, but plaintiff did not see fit to offer any of them in evidence (for plaintiff to have done so would have been an admission of the fallacy of any contention of seniority over the Colorado project), and it became necessary for the defendants to procure certified copies of the same. (Defendants' Exhibits 159 to 178 inclusive.)

It is admitted by plaintiffs that the permits enumerated by Mr. Meeker (1070-1, 3919-39), include *all of the permits and authority under which The Laramie Water Company* asserts any claim of appropriation for water for the Lake Hattie Reservoir system from either the Big or Little Laramie rivers in Wyoming. In other words, these permits represent all and the only authority of that company to construct irrigation works diverting water from these streams in Wyoming and of necessity the priority of each of these units is represented by the permit under which the same is authorized. *An inspection of the permits reveals the fact that Mr. Sevison's survey, commencing April 16, 1908, is the earliest initial act under which any of these canal or reservoir schemes were commenced,* or even contemplated, by their several promoters, and the evidence adduced by Wyoming witnesses proves conclusively that actual construction has taken place under but few of these many permits and that the claims predicated thereupon relate exclusively to the initial surveys rather than actual construction.

Arranged in order of priority, as represented by date of filing, these numerous permits of The Laramie Water Company's system (1070-1, 3919-29, Defendants' Exhibits 159 to 178), being the only and all the authority of that company to construct any part of their system, are as follows:

Date of Filing	Permit Number	Name of Ditch or Reservoir	Stream	Defts.' Ex. No.
April 21, 08	8612	Lake Hattie Supply Canal	Big Laramie River	159
May 11, 08	1372 Res.	Lake Hattie Reservoir		162
June 29, 08	8521	Stewart Ditch	Little Laramie River	170
July 6, 08	8519	Bell Supply Ditch #2 (Inter-watershed)	Douglas Creek over into Little Laramie	173
July 19, 08	1331 Res.	Bell Reservoir	Little Laramie and Douglas Creek	169
July 19, 08	8518	Bell Supply Ditch #1	Little Laramie	168
Sept. 11, 08	8613	Hattie Canal No. 1	Big Laramie	161
Sept. 18, 08	1939 Enl.	Enl. Lake Hattie Canal #1		164
Sept. 18, 08	1373 Res.	Enl. Lake Hattie Res.	Big Laramie River	163
July 3, 09	2113 Enl.	Enl. Pioneer Canal	Big Laramie River	165
Aug. 30, 09	10364	Interstate Canal #2	Big Laramie River	176
Sept. 15, 09	1883 Res.	Bath Reservoir	Little Laramie River	171
Oct. 15, 09	2051 Res.	Robertson-McConnell Res.	Big Laramie River (across channel at interstate line)	177

Dec. 5, 10	10363	Lake Hattie Supply Canal No. 2 (first and initial claim for this canal then first conceived)	166
Dec. 5, 10	2052 Res.	Bell Reservoir No. 3.....	172
July 11, 12	2720 Enl.	Lake Hattie Supply Canal No. 2 (first enlargement)	167
		Inter-watershed Diversions from Douglas Creek to Little Laramie River.	
July 6, 08	8519	Bell Supply Ditch No. 2.....	173
March 7, 12	11016-22	Bell Supply Ditch No. 2.....	175
March 7, 12	2538 Enl.	Bell Supply Ditch No. 2.....	174

The diversions classified under the last title are increment to the Little Laramie, but are included to show their general relation to the system, the dates of their first initiation, and the subsequent expansion of the ideas of the promoters.

Grouping the above mentioned appropriations of the Laramie Water Company's system according to the stream from which the diversion is made, the extent of the permitted diversions, and the degree to which each unit was wholly or partially completed at the date of the trial, is more graphically set forth as follows:

Filing	Number	or Reservoir	Diversion	Completed	Ex. No.
		Big Laramie			
Apr. 21, 08	8612	Lake Hattie Supply Canal..	(See 8613 and 1939 Enl.).	$34,000 yet required to complete this and 2113 Enl.	159
May 11, 08	1372 Res.	Lake Hattie Reservoir	(See 1373 Res.)	.....	162
Sept. 11, 08	8613	Outlet Canal Lake Hattie Reservoir	54,256.10 acres	Complete	161
Sept. 18, 08	1939 Enl.	Enl. " " "	6,597.17 acres	(None)	164
Sept. 18, 08	1373 Res.	Enl. Lake Hattie Res.....	93,800.00 ac. ft.	Complete	163
July 3, 09	2113 Enl.	Enl. Pioneer Canal (upper portion to Sodergreen Lake only)	(No claim other than included in 8612, 8613 and 1939 Enl.).....	(See 8612)	165
Aug. 30, 09	10364	Interstate Canal #2.....	22,544 acres (inc. in 10365)	None	176
Oct. 15, 08	2051 Res.	Robertson-McConnell Res...	335,831 ac. ft. (14,628,826,680 cu. ft.)	None	171
Dec. 12, 10	10365	Sand Creek Diversion (Feeder to Interstate Canal)	Included in 10364	None	178
July 11, 12	2719 Enl.	Pioneer Highline Canal.....	No claim from river. Merely a distribution lateral from inlet to Lake Hattie to 15,786.69 acres additional.	None	160

(NOTE.—No part of acreage under old Pioneer Canal is or should be claimed as included with lands to be served by above diversions. The appropriations of this old canal bear no possible relation to those of the new system.)

Little Laramie.

June 29, 08 8521	Stewart Ditch	95,569.74 acres	$46,000 yet to complete	170
July 19, 08 1331 Res.	Bell Reservoir	(25,000 acres included in Stewart application 8521)	None	169
July 19, 08 8618	Bell Supply Ditch			
Sept. 15, 09 1883 Res.	Bath Reservoir	37,604 ac. ft.	None	168
Dec. 5, 10 10363	Lake Hattie Supply Canal No. 2	(Included in 8612, 1372 and 1373 Res. Big Laramie)	Complete	166
Dec. 5, 10 2052 Res.	Bell Res. No. 3	117, 584 ac. ft. (5,121,988,144 cu. ft.)	None	172
July 11, 12 2720 Enl.	Enl. Lake Hattie Supply Canal No. 2	No additional acreage than already included in 8521 and 8613	None	167

All water diverted out of the watershed of the North Platte by the Bell Supply Canal No. 2 (only 15% complete) will augment the supply in the Little Laramie and relieve the demand from that stream to the extent of the increment. Here, Wyoming is doing what she would have the court deny Colorado the right to do, *i. e.*, to augment the supply of one tributary with water obtained from another tributary of the same general drainage.

RECAPITULATION.

Big Laramie.

	Canals	Reservoirs
Within the appropriation (1373 Res.) of 93,800 acre feet of Lake Hattie are included:		
(1) (8613) Outlet Canal Lake Hattie, water for.....	54,256.01 acres	
(2) (1939 enl.) Enl. Outlet Canal Lake Hattie, water for....	6,597.17 acres	
(3) (2719 Enl.) Enl. of use of water by lateral from inlet ditch to Lake Hattie called "Pioneer Highline," water for	15,786.69 acres	
Interstate Canal No. 2 (10364) has permit for water for.....	22,544.00 acres	
Total diversion Big Laramie for which permits granted since April 21, 1908	99,183.87 acres	
The Robertson-McConnell appropriation of 335,831 acre feet will be used largely as supplementary to above canals and Lake Hattie Reservoir. It may be used in any other locality and is evidently intended also as an independent supply, and, accordingly, to above should be added.....		335,851 acre feet

Little Laramie.	Canals	Reservoirs
Stewart Canal (8521), water for	95,569.74 acres	
Bath Reservoir (1883 Res.), water for		37,604 acre feet
Bell Res. No. 3 (long junior to James Lake Reservoir) is awarded permit for		117,584 acre feet
Total decreed to canals (as of priority June 29, 1908), water for	95,569.74 acres	
Total decreed to reservoirs as of priorities Sept. 15, 1909, and Dec. 5, 1910		155,188.00 acre feet

Both Laramies.	Canals
Big Laramie, water for	99,183.87 acres
Little Laramie, water for	95,569.74 acres
Total	194,753.61 acres

Also	*Reservoirs* (Other than Lake Hattie and Bell Res. #1)
Water for reservoirs which may be used on acreage additional to that served by above canals:	
Big Laramie	335,831 acre feet
Little Laramie	115,188 acre feet
Total	451,019 acre feet

(NOTE.—The call upon the Laramies will be reduced to the extent of the comparatively small amount of water received over the divide from Douglas Creek.)

(Engineer Bishop gives a total of 112,220 acres to be served by the Laramie Water Company's system as at present in process of construction. [781.])

Only those portions of the Laramie Water Company's system are completed whose construction has been along lines of least resistance and where no natural obstacles have interfered, viz.: Lake Hattie, its inlet from the Little Laramie, a portion of its inlet from Big Laramie, its main outlet ditches, and a part of the Stewart Canal. (779.) All these are on the open prairie along lines naturaly run by a level. On the main body of the system no work whatever has been performed, the Robertson-McConnell, Bath and Bell Nos. 1 and 3 Reservoirs, the construction of which would require the overcoming of natural obstacles and the expenditure of great sums of money in payment for labor (though still less expensive than that required upon the Greeley-Poudre system), remain as incomplete as on the day when the engineers folded their instruments and departed. Only that part of the work has been undertaken where expenditure of a relatively small amount of money (compared with the whole cost of the enterprise) will produce the greatest display. In Colorado the most difficult portion of the system, the tunnel, has been completed. In Wyoming the reverse is true, and the greater portion of the work still remains untouched.

(p) N. W. Land and Iron Company.

On June 3, 1909, The Northwestern Land and Iron Company, affiliated along with The Denver Laramie Realty Company as a subsidiary of The Denver-Laramie Railway Company, acquired the old Riverside ranch lying immediately below the Sodergreen ranch at the upper end of the Laramie Plains (south of Lake Hattie) and also the Hoge ranch, south of the Laramie River and immediately above the mouth of and along Sand Creek. The King Water Ditch had theretofore been used for the irrigation of river bottom lands of the Riverside ranch and the new company projected building this ditch on a higher line and extending it to the Hutton and Creighton Lakes on the Hoge ranch, which had theretofore been (and still are) used as immense evaporation waste basins, but which could be converted into storage reservoirs and used for the irrigation of unreclaimed lands on the latter ranch.

June 3, 1909, applications for permits Nos. 10149-50, 2304 Enl. and 1963 Res. were filed with the office of the State Engineer of Wyoming, wherein they sought the privilege of enlarging the King Water Ditch and re-building the same as the King Highline Ditch (2304 Enl.), for the purpose of filling Hutton Lake Reservoir (1962 Res.) and distributing the water by two outlet canals (10149-50). These applications were granted and permits issued October 17, 1910. (See

tabulated list from office of State Engineer, page 3961 of record.)

At the taking of testimony it was stated (285) that this highline ditch had been completed during 1912, with the exception of a flume across Sand Creek, and also that a portion of the work had been done upon the reservoir, but the scheme was generally incomplete. In enlarging the King Ditch, its former capacity was increased about 100%. (322.)

The record does not give the acreage to be reclaimed by this ditch and reservoir system, but it is safe to estimate that reclamation of at least 10,000 acres was contemplated in this new project thus first initiated June 3, 1909. This area lay to the south and west of that included within The Laramie Water Company's schemes.

(c) *Appropriations East of Laramie Mountains.*

The many small ditches irrigating native hay meadows along the narrow valleys of the numerous mountain streams joining to form tributaries which enter the Laramie River as it flows through the Laramie Mountains and traverses the region between the mountains and Fort Laramie, Wyoming, may be treated as of no real consequence in determining the relative rights of the larger projects here involved. The North Laramie, Chugwater and Sybille are the principal of these tributaries, although the waters of the Sybille are in large measure available for irrigation of the Wheatland tract, as we shall hereafter observe.

The appropriations along the valley of the Laramie from the mountains to Fort Laramie and in the vicinity of Uva, Wyoming, are of the same general character as those along the North Laramie, the Sybille and Chugwater (102-3), and are so abundantly supplied, both by the principal stream and the increment thereof gathered through the canyon, as well as by constant flow and discharge of seepage and return waters from the North Laramie (64), Sybille and Chugwater (173, 206), that time would be needlessly consumed by a discussion of their relative rights.

The principal irrigation within this general area, either from systems of several years standing or contemplated through new enterprises (many years subsequent to the Greeley-Poudre project) is limited to the enterprises of The Wyoming Development Company and its subsidiary, The Wheatland Industrial Company, the former of which promoted, constructed and subsequently managed the original Wheatland project, while the latter has undertaken the promotion and construction of two very recent projects adjacent to the original tract near Wheatland, Wyoming.

(c-1) Wheatland.

(*x*) *Original Project.*

The reclamation of about 60,000 acres situated to the south and above the Laramie River after it leaves the Laramie Mountains, and bounded on the east by the Chugwater and the west by the Sybille, was originally undertaken by The Wyoming Development Company during the '80's.

This original Wheatland area, of nature, depends for its reclamation entirely upon water supplied by the Chugwater or the Sybille, principally the latter, and the promoting company constructed two canals for the irrigation of the Wheatland area by waters to be diverted from the latter stream. Wheatland Canal No. 1 was constructed along the southern edge of the Wheatland flats or table land (and along the northern toe of the hills bounding the area on the south), and terminated about one and one-half miles from the present Town of Wheatland. Canal No. 2 diverted water some eleven miles further down the Sybille, flowed over the western and northern portion of the tract and through the Town of Wheatland. (158.)

While the Sybille is approximately fifty or sixty miles in length (103), and has a considerable drainage with a constant flow (39), the promoters of the enterprise realized that the water supply from this drainage was insufficient for the proper reclamation of the project.

Bluegrass Creek forms a tributary of the Sybille, entering about one-half mile above the head of Wheatland Canal No. 1. The drainage area of the Bluegrass near its source is next adjacent to and separated from the drainage of the Laramie by a very narrow mountain range, quite similar to the division of the drainage area of the Cache la Poudre and the Laramie in Colorado. At opposite points on the two streams, the elevation of the Bluegrass is considerably below that of the Laramie, and water is diverted from the Laramie and conveyed to the Bluegrass by means of a tunnel about 2,585 feet long (176) constructed through the intervening mountain. While the diversion of water from the Laramie to the Bluegrass and thence by way of the Sybille to the Wheatland area would result in diversion of water from one watershed through the divide for application upon lands situate in the watershed of another stream (exactly similar to the Colorado diversion by the Greeley-Poudre system), the Wyoming promoters, under sanction of the authorities of that state, constructed a tunnel through this narrow mountain divide and thereupon diverted the water of the Laramie which they have since hitherto used to supplement the supply from Sybille Creek for the irrigation of the original Wheatland area.

January 29, 1898, application for permit was filed with the State Engineer of Wyoming by The Wyoming Development Company for right to construct Wheatland Reservoir No. 2 in the pit or lowest portion of the Laramie Plains area and situate about 16 miles above the western portal of the Wheatland tunnel, so diverting water from the Laramie over into the drainage area of the Sybille. (29, 48.) The application having been granted, actual construction commenced in 1899, and in July, 1901, a reservoir with an impounding capacity of 126,000 feet was completed across the channel of the Laramie River. (48.) The waters impounded in this reservoir are re-discharged into the Laramie and are thence conveyed to and through the Wheatland inter-watershed tunnel and into the Sybille drainage for re-diversion to the Wheatland tract.

During the thirty years following the initiation of the project and prior to the taking of testimony in this case, about 33,544 acres out of the tract had been reclaimed. (168.) Throughout practically the entire period, diversion and storage of water has been governed solely by the desires of The Wyoming Development Company, who have acted on their own motion, helping themselves to the abundant water supply without any supervision by water commissioner or state officials, with the possible exception of the very dry year of 1911. Constant irrigation has caused the underground water-plane to gradually rise so that seepage has already appeared in portions of the area with consequent reduction of demands upon the canal for the irrigation of portions of the area (200-1), and although a considerable portion of the original tract is still unreclaimed, the water supply is sufficiently abundant (94) to have warranted opening two new and collateral enterprises which we shall next consider. (205-6.)

(*y*) *New Projects.*

The Wheatland Industrial Company is formed of members of The Wyoming Development Company. (86.) It was organized for undertaking reclamation of two Carey Act projects lying upon foreign watersheds, but immediately adjacent to the original Wheatland tract and known as the Bordeaux and Sybille tracts.

The reclamation of these tracts is to be accomplished by construction of new and independent enlargements of portions of The Wyoming Development Company's tunnel and canals and also a new and independent canal from Bluegrass Creek. (41, 61.)

(*y-1*) *Bordeaux Tract.*

The Bordeaux tract comprises about 10,000 acres of rough, rolling land (67) lying south and east of the original Wheat-

land tract, within the drainage of a tributary of Chugwater Creek and separated from the original tract by a range of hills. (41.) By construction of a short tunnel through this rocky divide, water flowing in Wheatland No. 1 Canal along the south edge of the Wheatland tract is carried through the divide and into the drainage of this tributary of the Chugwater for irrigation of the new Carey Act project. (41.) The thought of possible future reclamation of this Bordeaux tract by means of a new double inter-watershed system in part built through portions of the original Wheatland system by enlargement, first suggested itself in 1904, but no serious efforts were directed toward its construction until the year 1907.

On *April 18, 1907*, The Wyoming Industrial Company, theretofore organized, made application with the State Engineer of Wyoming for permit to enlarge Wheatland Canal No. 1 for the irrigation of the Bordeaux tract. This application was approved on the same day and permit No. 1681-E was issued to the Company. (3961.) During 1907-8, the inter-watershed tunnel between the Laramie and the Sybille drainages was slightly enlarged at the upper end. (186.) There was a slight enlargement of The Wheatland or Wyoming Development Company's Canal No. 1 to the foot of the rocky ridge between the Laramie and the Sybille, the new tunnel was constructed through the rocky divide (41) and a new canal known as The Wheatland Industrial Company's Canal No. 1 (211) was completed around the upper boundaries of the Bordeaux tract for its reclamation. (108.) In the five years elapsing between completion of the canal and the taking of testimony, about 1,004 acres out of the 10,000 acres of the project have been brought under irrigation. (168.)

That the reclamation of this tract was undertaken long subsequent to the initiation of the Greeley-Poudre project is evidenced by the testimony of M. R. Johnson, for many years general manager of The Wyoming Development Company, who said:

> "*This Bordeaux tract is a separate and new tract of the land added recently.* We contemplate irrigating it through No. 1 Canal. We enlarged No. 1 Canal for that purpose. The tunnel was deepened in later years and the enlargement of No. 1 Canal was made for the purpose of obtaining additional water for the Bordeaux and Sybille tracts.
>
> *These two tracts were not in contemplation when I went in charge of the system in 1888 or when we constructed our Reservoir No. 2 in 1900.*" (41-2.)

(*y-2*) *The Sybille Tract.*

The Sybille or Cooney Hill tract, 30,000 acres of land much inferior to that of the original Wheatland Tract (68, 169), is surrounded on the west, south and east by spur ranges of the Laramie Mountains. Sybille Creek flows between the easterly of these ranges and the original Wheatland tract while the ridge at the south of the new tract forms the northerly portion of the divide of the Bluegrass drainage in that vicinity.

Mr. M. R. Johnson said:

> "The Sybille or Cooney Hill tract will be irrigated out of the canal taken directly from the Bluegrass Creek. *This is a new and independent canal* taking water from Bluegrass before it reaches the Sybille Creek. The Sybille tract lies across the Sybille west from the original tract." (40-1.)

Neither the Sybille nor the Bordeaux tracts were in contemplation at the time of the construction of the original enterprise, nor the Wheatland Reservoir No. 2 (42.)

The idea of developing the Sybille tract occurred to the promoters some two years subsequent to their first contemplation of the Bordeaux tract. (40.) In order to irrigate the tract, it is necessary to make a double inter-watershed diversion from the Laramie River, viz., first, from the Laramie River through a new enlargement of the old Wheatland tunnel into the Bluegrass, and then again from the drainage of the Bluegrass over into the watershed of the Sybille tract by another 900 foot tunnel constructed through the divide at the lower end of a new canal leading from the Bluegrass. (211.)

Surveys for this new canal and inter-watershed diversion from Bluegrass Creek, thereafter to be known as The Wheatland Industrial Company's Canal No. 2, are alleged to have been commenced in 1907 (108), but application for permit was not filed with the State Engineer until *August 7, 1908.* This application was approved and permit No. 8531 was granted on the following day, August 8, 1908. (3961.) Construction began in July, 1910, almost two years subsequent to the approval of the permit (108), and the new 16 mile canal (169) of 300 second feet capacity, together with this 900 foot tunnel through the divide between Bluegrass Creek and the tract, was largely completed in 1911-12 (212), although still incomplete at the time of taking of testimony. (67.) No part of the tract has been reclaimed.

The original Wheatland tunnel was constructed exclusively for service of the original Wheatland tract. Reclamation of the

new Bordeaux and Sybille tracts required the invention of new means of serving these additional lands. This could be more feasibly accomplished by building a new tunnel within the old tunnel, by enlargement of the latter. While some slight enlargement took place in 1907, the principal enlargement for service of the Wheatland Industrial Company's new tracts did not occur until during the fall of 1910 and spring of 1911. (176, 180.) The old tunnel was greatly enlarged, as much as two feet of rock were taken out of the bottom and it was finished to an average width of 8 feet, a cross-section area of 72 feet and a capacity of about 800 second feet, which is somewhat limited by the capacity of the intake canal from the Laramie River to the upper portal of the tunnel.

Storage of water for the Bordeaux and Sybille tracts will occur in Wheatland Reservoir No. 2 (115), save as obtained from the Bluegrass and Sybille or directly from the river from increment below the large reservoir.

All of the old project is prior to August 25, 1902, at least in so far as developed up to that date. Of the new tracts projected, promoted and constructed under the new, The Wheatland Industrial Company, we have the following:

Permit Number	Project	Date of Filing	Acres
1681-E	Bordeaux Enl. Wyo. Dev. Co. Canal No. 1	April 19, 1907	10,000
8531	Sybille Canal and Tunnel (Sybille Canal not quite complete 1913. Bordeaux Canal complete. Only 1,004 acres out of combined 40,000 acres in projects irrigated prior to 1913).	August 7, 1908	30,000

(d) Recapitulation of all Wyoming New Appropriations since 1902.

All large projects constructed or permitted for the diversion and application of water from Laramie River to lands in Wyoming subsequent to August 25, 1902, are summarized as follows:

Date of Survey	Date of Filing	Project	Acreage	Add. Permitted for Storage (Acre Feet)	Portion Completed
'04	Apr. 18, '07	Wheatland Ind. Co. (Bordeaux System)	10,000	.....	Complete
Aug. —, '07	Aug. 7, '08	Wheatland Ind. Co. (Sybille Tract)	30,000	.....	Almost Complete
Nov. —, '07	Dec. 27, '07	Sodergreen Highline	3,400	.....	Complete
Mch. 22, '08	Mch. 27, '08 (et seq.)	Lake James System.....	30,000	.....	Complete
Apr. 16, '08 (et seq.)	Apr. 21, '08	Laramie Water Co or Lake Hattie System	194,753.61	451,019	Partially Completed
	June 3, '09	N. W. Land & Iron Co. (est.)	10,000	.....	Partially Completed
Total acreage for which permits have been granted by State Engineers of Wyoming since August 25, 1902...			278,153.61		

In addition to the above acreage thus granted permits, we have the Bath, Robertson-McConnell and Bell No. 2 Reservoirs of The Laramie Water Company's system showing an additional grant from the river of 451,019 acre feet.

The foregoing are the solemn decrees of the plaintiff State of Wyoming entered through her eminent state engineers, Clarence T. Johnston and A. J. Parshall. They constitute official declarations against interest by plaintiff and are the solemn guaranty to all the world (1) that there was *ample water* in the Laramie River on the date of each respective decree (permit) to supply the appropriation granted permit, *after* having supplied *all prior claims* from the stream, (2) that *no injury* would result to other and prior appropriators by the construction and subsequent operation of each of the series of works thus directed to proceed with construction, diversion and application of water, and (3) that the granting of each of said *permits does not threaten public interest.*

Each of said permits was also the solemn decree of the State that the appropriation thereby granted should have *priority as of the date of the filing* of the application and not theretofore, by reason of the fact that no right, and consequently no priority, can attach until after such application should be granted and permit issued, in which event the statute fixes the priority.

Here we find the plaintiff state solemnly decreeing that *after all* lands then under irrigation, or for the irrigation of which permits and appropriations had theretofore been granted or vested, had been and would forever be supplied with sufficient water for their annual reclamation, there still remained in the Laramie River sufficient water to annually irrigate 278,153.61 acres additional, and, furthermore, that there existed sufficient water in the stream to warrant the construction of reservoirs for the storage of over 450,000 acre feet of water for irrigation of these or still other lands, after having already supplied the enormous reservoirs included within the acreage permits above mentioned.

These decrees were not entered on the spur of the moment or directed by single influences, interests or prejudices. On the contrary, each was deliberately entered after mature consideration and with full knowledge of all conditions. (See time elapsing between time of filing and granting.) Furthermore, we have the benefit of the deliberate, dispassionate judgment of the two eminent experts who successively acted as State Engineers of Wyoming during the years 1907-13, inclusive. The judgment of these eminent men, whose only interest was that of protecting the public and those who might otherwise be induced to invest their money in unfortunate ventures improperly approved, should be of greater weight than that of some mere

hydrographer employed by and responsible alone to one of the promoting companies and representing but one of the several enterprises and not the state or even a goodly number of the interested appropriators.

We fail to reconcile these decrees of the plaintiff state, inferentially to secure the investment of enormous sums of money in construction, with the testimony of hydrographer Meeker of The Laramie Water Company (not the State of Wyoming), who was generally unfamiliar with the territory prior to 1912 and whose radical deductions were confessedly in frequent error, the greater portion of whose testimony had to be discarded, corrected and reconsidered, and who placed his judgment, founded on mere reconnaissances and hasty investigations, against the results of months of field labor by fully equipped engineering parties.

Neither of the eminent state engineers of Wyoming was offered as a witness by Wyoming. Neither of them was called upon to verify the truth concerning the permits by him granted, or to justify the expenditure of private moneys thereby permitted under state approval, which would be but the promulgation of fraud by the state if in truth sufficient water supply did not exist in the stream to satisfy these new diversions (all junior to 1907-8) after having supplied all prior initiated or completed systems.

Wyoming did not even introduce evidence or copies of the several permits above mentioned in order that her own decrees might appear in the record. On the contrary, reliance seems to have been placed entirely upon the confessedly erroneous, shifting and reconstructed testimony of one private-employee witness and upon the introduction of evidence and decrees for old irrigation systems in no way here involved and confessedly so bountifully supplied with water as to permit unlimited waste after each appropriator had taken his full "lion's share" and there still existed sufficient in the stream to supply all others who likewise helped themselves without the service of a water commissioner or other supervising official.

It remained for the defendants to introduce copies of these permit-decrees. By their introduction we have the uncontradicted testimony of the engineers who granted them *that none of the recent large Wyoming appropriations were initiated prior to 1907-8* (this was also universally admitted upon cross-examination of all Wyoming witnesses having knowledge of the facts) and that many of them were not even conceived until about the time of or subsequent to the filing of complaint in this case, and *that Wyoming has officially admitted, declared and decreed that after all prior appropriations from the entire Laramie River and tributaries* (including, of course, the comparatively insignificant diversion by the Greeley-Poudre enter-

prise in Colorado, *there still remains sufficient unappropriated water to justify the granting of permits* authorizing the expenditure of vast sums of private money for the construction of large new and theretofore uninitiated systems for the irrigation of 278,963.61 acres more of land than had theretofore been reclaimed, and that in addition thereto enough water still remained in the stream after supplying Lake Hattie, James Lake and all other reservoirs included within the above acreage, to justify the construction of reservoirs to impound over 450,000 acre feet additional.

This testimony, given through these many permit-decrees by these eminent state officials chosen by the people to examine and pass upon all projects before permitting construction to commence and to decree thereunto the solemn guaranty of the Commonwealth, is conclusive answer to any contention that the Wyoming projects are senior to the Greeley-Poudre project, or that the latter may in any possible manner injure or interfere with any of the older projects in Wyoming constructed prior to August 25, 1902.

---

(4) PLAINTIFF'S ERRONEOUS ASSUMPTIONS.

(a) Plaintiff's Exhibit "G."

The record shows, without contradiction, and counsel for plaintiff admit, that only a portion of the lands situate beneath the old Pioneer Canal on the Laramie Plains and but little more than half of the original Wyoming Development Company's tract near Wheatland are reclaimed. The exhibits under which Wyoming claims appropriations for all her new large enterprises, and particularly the James Lake and Laramie Water Company's system on the Laramie Plains, and the Bordeaux and Sybille tracts adjacent to the original Wheatland tract, show conclusively that the Laramie Plains projects were not initiated in the one instance before March and April, 1908, and before 1907 in the other, and that but a very small percentage of the lands under these newer projects had been brought under reclamation at the time of the trial of this case.

R. I. Meeker, the "expert" for The Laramie Water Company, testified that his knowledge of the territory did not begin until May, 1912 (217). He testified at other times to the acreage irrigated under the Pioneer system and the fact that practically none was reclaimed under The Laramie Water Company's new system. He also admitted that the permits which we have heretofore considered in detail are the *sole and only permits* under which The Laramie Water Company's system has

been constructed, or upon which their priorities are predicated, the earliest of which was April 21, 1908 (1070-1).

In the face of the entire record and his own testimony, Mr. Meeker prepared a map marked Plaintiff's Exhibit "G," whereby he would portray and classify as under priorities before and subsequent to 1900 the various lands irrigated from the Laramie River. The selection of the arbitrary date 1900, which happens to be prior to August 25, 1902, would lead the mind to believe that some development took place at about that time, when in truth no new Wyoming development occurred prior to 1907-8. This map, by artful coloring, would indicate priorities as of 1900 for lands still unreclaimed and the construction of works for the irrigation of which did not commence even by survey until about six years after the Colorado project was commenced and prosecuted in good faith, and is a misrepresentation of all the evidence relating to priorities and irrigated areas.

A lengthy detailed objection was made to its introduction (1030-2). It is particularly misleading and false in that: The legend on the map shows that Mr. Meeker had colored in green all lands which he wished to leave the impression had received irrigation development prior to 1900, and in yellow those subsequent to 1900. He erroneously includes all of the land under both the Pioneer and the original Wheatland systems in solid green, thus indicating that they were all reclaimed, and also shows as irrigated certain unreclaimed lands lying between the Pioneer Canal and Lake Hattie. Under the yellow tint he notes as under irrigation since 1900 the great bodies of still unreclaimed lands under the James Lake, Lake Hattie, Sybille and Bordeaux tracts, when the permits for these systems, his own testimony, and the entire record shows that none of the works for the reclamation of these lands were commenced, much less were the lands irrigated, prior to 1907-8, and that the initial surveys on the major portion of them began in the spring of 1908, while the Pioneer Highline Canal, as we shall hereafter observe is still but a fiction, was not granted permit until January 8, 1913, and no part of the same has ever been constructed.

Undoubtedly, these new large projects, particularly that of his client, The Laramie Water Company, were initiated *subsequent* to 1900, 1800, 1700, or any other date before 1907-8. The official records show that the epochs of development on the Laramie Plains naturally occur either before or after the Spring of 1908, and not 1900. This was some six years subsequent to August 25, 1902, when the Greeley-Poudre project was commenced in Colorado, and it is uncontradicted, even by Mr. Meeker, that these Wyoming projects are junior and inferior both in time and right.

No attempt was made by the owner of any of these large

new Wyoming projects to deny that they are all between five and six years junior to the Colorado project, and no tendency to cloud the record was evidenced by the employees of any system save the repeated efforts of Mr. Meeker for The Laramie Water Company, whose constantly changing water data is on a par with the effort displayed by the map, Exhibit "G."

His notations and delineations upon that portion of the map referring to the Greeley-Poudre system in Colorado are equally fallacious. The intent of those having charge of this project in its early stages, their well defined plans at the very outset and their subsequent conduct and that of their successors in directing both engineering and construction, are covered in a long line of uncontradicted testimony. This record shows adherence to the one original plan throughout all the years succeeding August 25, 1902, all leading to the completion of the Greeley-Poudre tunnel system. On Exhibit "G," this witness ignores the uncontradicted evidence and seeks to portray, by ingenious mapping and an unwarranted interpretation, an original plan and intent entirely foreign to the truth as given by all witnesses. In fact, the exhibit is as hopelessly misleading and distorted in this regard as it is in its fictitious priority conclusions.

The entire exhibit seems to have been prepared in the hope of leaving an impression that the Wyoming systems were commenced anterior, rather than subsequent, to the Greeley-Poudre project, and its only evidentiary value lies in its manifestation of the length to which its author would go to cloud the record on the subject of priorities. We are at a loss to know why plaintiff should have caused this fictitious map to be prepared, and the more, why it should have been offered in the face of a complete record of contradictory evidence.

Plaintiff's counsel, on page 37 of their brief, seek to capitalize this and other numerous mistakes of their witness, by stating that this "expert" cheerfully admitted and corrected his mistakes, although such mistakes, in truth admissions of error, were always reluctantly obtained through rigid cross-examination and were usually almost as glaring and incompatible with the facts as are the fictitious assumptions of this "expert" on his Exhibit "G." He was enabled to frequently correct the "mistakes" in his other testimony, but, once introduced, the fallacy of his map, Exhibit "G," could not be so readily corrected, and displays his reckless treatment of the facts, and yet this is the witness whose attempted criticism of the testimony of John E. Field, State Engineer of Colorado (4293), counsel for plaintiff quote for the purpose of discrediting all of the testimony of Mr. Field (page 37). Fortunately, all of Mr. Field's testimony is amply corroborated by such eminent men as Dr. L. H. Bailey, late of Cornell University,

Professor Louis G. Carpenter, Charles R. Hedke, and many other witnesses, and by photographic and other exhibits, while this witness is not only contradicted by all the testimony, both for Wyoming and Colorado, including his own, but is repeatedly compelled to correct his hasty, ill-drawn conclusions and to substitute others in their stead. We may observe that nowhere in Mr. Field's testimony do we find an Exhibit "G" and a long series of errors reluctantly admitted on cross-examination and repeatedly attempted to be remedied, only to be again confessedly in error.

We need but suggest that the permits, decrees and decisions of two state engineers of Wyoming and the frank statements of every other witness who testified concerning these facts, are superior to and predominate over the unfortunate conclusions attempted to be drawn by this witness, whose map, Exhibit "G," should be eliminated from consideration in order that error and confusion may be avoided.

(b) The Mythical Pioneer Highline Canal.

July 11, 1912, The Laramie Water Company filed in the office of the State Engineer of Wyoming two applications for permit to use, by a system of exchange with the river, water from Lake Hattie Reservoir for the irrigation of lands naturally situated beneath a lateral line, then first conceived, and commencing on the inlet canal to that reservoir just before the water drops into the basin and extending with the natural contours of the Plains around the lake basin and to the east. This *exchange* was to be accomplished by diverting water from the Laramie River by means of the inlet canal of the Lake Hattie system (first surveyed April 16, 1908 and later largely completed), and carrying the same from the inlet and thru this new highline lateral for direct application upon lands irrigable therefrom, and, at the same time, returning and discharging back into the Laramie River, at a point lower down on the stream, water in equal quantity with that diverted at the headgate of the new 1908 inlet canal.

A certified copy of this application and the map attached thereto were introduced in evidence as Defendant's Exhibit 160. The map shows the line of this canal, which it designates as the "Pioneer Highline Canal," as commencing, *not at the river* and *not at the old Pioneer Canal*, but, *on the* new inlet ditch just above the point of discharge from that canal into Lake Hattie. This map and the application also shows that it was the *newly* conceived intention of this company to intercept water flowing from the *Little Laramie River* through the new Lake Hattie Supply Canal No. 2, first surveyed in June, 1910, and likewise to compensate for such intercepted water by de-

livery of equivalent amount from the Lake Hattie Reservoir back to the river.

By the express provisions of the application for permit (Exhibit 160, part 2) for this new highline lateral ditch from these two 1908 and 1910 canals, and thus to be constructed at some possible future date, the waters to be by it conveyed are limited as follows:

> "Waters to be diverted from the Laramie River for use under the terms of this application is to be carried through the Pioneer Canal *enlargement* (see permits 8612 and 2113 Enl.). The right is sought for permit for direct use from Big and Little Laramie rivers from lands served by the Pioneer Highline Canal.
>
> (1) *by the use of the waters appropriated under permits 8612 and 2113 Enl.*, directly through the Pioneer Highline Canal instead of being stored in Lake Hattie Reservoir, and then applied to lands described under secondary permit 8613;
>
> or (2) *by returning stored water from Lake Hattie Reservoir* (1372 Res., and 1373 Res.,) to the Laramie River, equal in amount to that diverted from the Big or Little Laramie rivers for the direct use on lands served by the Pioneer Highline Canal;
>
> or (3) *by the use of water appropriated under permit 8518* directly through Bell Supply Canal No. 1 into Lake Hattie Supply Canal No. 2 into the Pioneer Highline Canal instead of being stored in Bell Reservoir No. 1 (permit No. 1331 Res.) and then applied to the lands described under secondary permit No. 8521, primary permits Nos. 1331 Res., 2051 Res., 2052 Res., and 8518, 8519, 2538 En., 11016, 11017, 11018, 11019, 11020, 11021, 11022 and Reservoirs in Colorado many further additional and supplemental supplies."

It will be observed that all of the foregoing permit numbers pertain to appropriations of water theretofore permitted to The Laramie Water Company's system from the Big and Little Laramie Rivers and not otherwise, the earliest of these permits being No. 8612 filed April 21, 1908 and predicated on surveys begun immediately prior thereto (Defendants' Exhibit 159). (See table of Laramie Water Company's permits heretofore appearing.)

In order that the intentions of the claimant might be in no way misconstrued and that no one could ever assert that they claimed the right to use any priority of water earlier than April 21, 1908, the applicant further limits itself as follows:

> *"It is understood that nothing contained in this permit shall be construed as meaning the additional appro-*

priation of any amount of water in excess of the total amount covered by permits heretofore issued as a part of The Laramie Water Company's system."

On January 8, 1913, State Engineer A. J. Parshall granted permit No. 2719 Enl. upon the foregoing application (Exhibit 160) so containing its own limitations relative to the appropriation from which the supply of water was to be derived. But in order that no possible claim could ever be made for water other than that specifically described and limited in the specification, viz.:—beginning with priority 8612 of April 28, 1908, the state engineer imposed the following limitations and conditions:

"*Waters* diverted from the Big and Little Laramie rivers under the terms of this permit *in excess of the amount covered by permits heretofore used, must be immediately returned* in equal amount to the Laramie River from the Lake Hattie Reservoir, *in such manner as to in no way interfere with prior rights on the Big or Little Laramie Rivers.*"

Under the Wyoming law the appropriator must have a permit before he is authorized to enter upon the construction of his canal. No right or appropriation can possibly vest until a permit is granted. The granting of the permit and the vesting of the right are coincident. Hence it is that whatever right is granted by the State of Wyoming in the exercise of its sovereign authority over the waters within its own borders, is limited absolutely by the conditions included in the permit at the time of the grant.

Here we find that this lateral canal, by means of which The Laramie Water Company was permitted to include additional acreage under its system, was limited at its birth to the use of only such waters as were represented by permitted appropriations theretofore granted to The Laramie Water Company and its predecessor since April 21, 1908, *and no more.* In other words, it is only permitted to use water of priority date beginning with permit No. 8612 of April 21, 1908, and including the benefit of the subsequent priorities and permits granted that system up to and including the year 1912, and by the terms of the permit itself *no claim could be made for any earlier appropriation than* that represented by this permit 8612.

Notwithstanding the limitations thus self-imposed by The Laramie Water Company, the appropriator, and by the State Engineer of plaintiff state, this mere lateral canal thus filed July 11, 1912, but granted the benefit of use of water on exchange from appropriations beginning with April 21, 1908, is

used through its name "Pioneer Highline Canal" as the pretender by which The Laramie Water Company and plaintiff state now seek to antedate The Laramie Water Company's claims over those of the Greeley-Poudre system in Colorado. While this permit is regular upon its face and most explicit and definite in its limitations and constitutes the solemn decree and admission of the plaintiff sovereignty as entered by its officer, the state engineer, the ingenious designation of the canal is sought, without the slightest foundation in fact, and in absolute contradiction of the solemn decree of the state, to be coupled with random, disconnected previous acts of parties foreign to the enterprise, in order to obtain semblance of early priority.

It will be recalled that Trowbridge and Niver of Chicago sent their engineer, Mr. Sevison, into the Laramie Plains district to explore, locate and survey the Lake James and Lake Hattie systems during the spring of 1908 (605); that on April 16, 1908, he commenced the first survey on the Lake Hattie system (646); that the whole matter was one of first impression to him and that no old maps or surveys were given to or followed by him (661); that as a result of these surveys the entire new Laramie Water Company's system was inaugurated and in part subsequently constructed, and it is upon faith of these surveys and the permits subsequently filed that this Pioneer Highline permit was granted.

It will be further recalled that after beginning work on Lake James, Mr. Sevison first made a survey of Lake Hattie to see if it could be feasibly converted into a reservoir (653); that having so determined, he sought a proper line for an inlet canal from the Big Laramie to the lake, and in so doing surveyed three preliminary *inlet* canal lines (not highline laterals) from the Big Laramie River to Lake Hattie (652); that by these surveys he found that the old Pioneer Canal occupied in part the natural and most feasible location for construction of the upper portion of a new inlet canal to this natural lake or reservoir (652); that the mountains in this vicinity rise abruptly from the table land of the Laramie Plains; that the natural location of a ditch line follows the toe of these mountains at the point where they leave the plains; that the Pioneer Canal occupied the upper portion of this strategic position and that by building a new canal beside or within the old canal by enlargement from the river to Sodergreen Lake and there diverting and running the new ditch at right angles to the old canal along the toe of Sheep Mountain, the best and most economical line for the new inlet canal would be selected. (652.)

While good engineering dictated that it would be most economical to build the new inlet canal by enlarging the old

Pioneer as far as Sodergreen Lake, the promoters of the Lake Hattie enterprise had no interest in the old Pioneer Canal and it formed no part of their original plan of development (661.) While the construction of the new canal for part of its way through the old line by enlargement would afford the required additional space and need in no manner interfere with the use of the old canal for conveyance of water for irrigation of its lands, nevertheless it was necessary to make satisfactory arrangements before the promoters of the new enterprise could enter upon and enlarge their old canal.

Mr. Sevison's efforts were in nowise directed toward the survey of any canal corresponding to the Pioneer Highline (as improperly asserted on page 77 of the Wyoming brief) for the direct irrigation of any lands, but were directed solely toward the utilization of the Lake Hattie Reservoir as a storage basin for irrigation of lands by means of inlet and outlet canals thereto and therefrom. As he surveyed for the inlet canal around the toe of Sheep Mountain at the western edge of the Laramie Plains along this strategic position so fixed by nature, which every engineer must inevitably follow, by pure accident and without knowledge or information of any previous surveys, he encountered a few old stakes from time to time, but which he in nowise followed or regarded as he proceeded with his new surveys (660-1.) Of these old stakes he said:

> "*No old maps were given me that I followed and no old surveys.* Until I ran into those stakes I didn't know there had been any survey run there. I would think that these stakes had evidently been placed on some preliminary line run from the Pioneer Canal in the neighborhood of Sodergreen Lake. They would indicate a grade line run from Sodergreen Lake (661.)
>
> I do not know by whom these old stakes on the Highline, which Mr. Corthell mentioned, were placed. Judging from their condition they were pretty well weather beaten. I should say they were ten years old anyway.
>
> It is nothing unusual to find stakes of old surveys in running lines. *This was the natural and most feasible line for the continuation of the lateral or highline from the Pioneer Canal.* (660-1.)
>
> I should say *they were indicative of a fly line survey or preliminary survey. They certainly were not final location stakes.*"

Of the Pioneer Canal, the enlargement of which for a short distance along the upper part of its course was most feasible in constructing the new inlet canal for Lake Hattie, Mr. Sevison says:

"It was not a part of the original plan to take the Pioneer Canal (661)."

Accident and natural conditions alone suggested some arrangement with the Pioneer Canal people for increased capacity to make room for the new and foreign water of the new inlet canal without in anywise interfering with the use of the old canal for service of the lands beneath it. An arrangement to this effect was not completed until about one year subsequent to the time of the Sevison survey for the Chicago promoters (662.) The old canal had a capacity of about 300 cubic feet per second and subsequently it was enlarged only in that portion from Sodergreen Lake upward to the river, to a capacity of something over 1,200 cubic feet per second, but this old canal was in no way enlarged or disturbed from Sodergreen Lake to west of Laramie City and it still performs the same and presumably only those functions for which it was originally constructed. (656.)

The new enterprise was being constructed purely under rights obtained by permits granted upon and following the Sevison surveys and the mere fact that this old canal was enlarged had absolutely no bearing and in no way involved the old appropriations of water theretofore and since hitherto used for the irrigation of lands situate beneath and by it served. All enlargement diversions of necessity fall under the 1908 and subsequent appropriations and are governed entirely by the permits authorizing the enlargement.

The old Pioneer Canal was constructed on low grade from the stream to Sodergreen Lake at the edge of the table land. From the lake the canal was constructed, without regard to fall or grade, northeasterly toward and beyond Laramie. In other words, while the canal followed a line or grade conforming to good engineering from the river to Sodergreen Lake, this plan was abandoned beyond that point and a continuation of the grade line of the upper portion of the canal would have followed the base of Sheep Mountain around to the north and then to the east of Lake Hattie Reservoir rather than passing along the direct line toward Laramie.

Any inlet canal constructed from the river to Lake Hattie for the purpose of carrying water to that lake would naturally have followed this grade line around the base of Sheep Mountain after leaving the Pioneer at Sodergreen Lake. Such would be the condition, not by selection, but by necessity, and any inlet canal surveyed from the river to the lake would not necessarily have any reference to or connection with any possible lateral line continued on around the lake to the northeast.

During the early 80's and 90's, some desultory reconnaissances and random, disconnected investigations had been made

by some four or five persons for a possible lateral from the Pioneer Canal at Sodergreen Lake, for possible irrigation of lands from the Pioneer Canal, and not at all for the purpose of utilizing Lake Hattie as a reservoir. All of these surveys, as we shall later observe, were insignificant, preliminary, and were not followed either by filings with the State Engineer or any construction, and all of them passed into the legendary stage long before the Chicago promoters entered the field without knowledge of them, through the Arnold Engineering Company in 1908.

Mr. Sevison was looking for a means of constructing a new inlet canal from the river to Lake Hattie Reservoir, without any reference to the old Pioneer Canal or any of its visionary laterals. He had no knowledge of any previous surveys, and gave no heed to some of the preliminary stakes which he found upon the ground and which had evidently been left by surveyors in these early preliminary reconnaissances.

In spite of these indisputable facts, a fictitious connection is sought between this mythical lateral, dreamed of but never constructed, and the different locations of each of these old random surveys, and at the same time, contrary to all the record, the language used would imply that the construction of the new Lake Hattie inlet, surveyed without knowledge of or reference to this old imaginary lateral, was in fact construction of the lateral. In addition, it is asserted:

> "It is interesting to note that the Lake Hattie system was constructed by the owners of the Pioneer Canal." (Page 76.)

It is true that the promoters of the Lake Hattie system, by necessity, made arrangements whereby they could *enlarge* the old Pioneer Canal for a short distance between the river and Sodergreen Lake and to that end became part owners in that canal long after they had initiated their project and surveyed and obtained permits for their new reservoir and inlet. But to state that the Lake Hattie system was constructed by the owners of the canal is to wrongly imply that the original owners of the Pioneer Canal had undertaken to construct and complete Lake Hattie system. Such was not the case.

Following this false premise, counsel, on page 76 of their brief, then seek to incorporate the several early preliminary reconnaissances made with relation to an imaginary lateral from the Pioneer Canal, with the surveys made by Mr. Sevison, contrary to the testimony of Mr. Sevison and the entire record, including all of the permits under which the Lake Hattie system claims. Notwithstanding the fact that Mr. Sevison positively stated that his surveys for an inlet canal to Lake Hattie had no reference to any so-called Pioneer Highline Canal, they state:

"When Sevison made his survey preliminary to actual construction of the highline canal, he found the stakes of one of these old surveys and followed the line so marked very closely."

In the first place, there never was any construction upon any highline canal or lateral in 1908 or at any other time. Mr. Sevison so stated, and so did Mr. Bishop, the engineer who finally filed the application for permit for a different lateral from a different ditch but with a similar name. Sevison did survey the new inlet canal (not lateral) from Sodergreen Lake to Lake Hattie purely, and only, for carriage of water from the river to the new reservoir, and this inlet was later largely completed, and in following the toe of the mountain he did, accidentally and casually observe some old stakes, but he specifically says that he gave no heed to them and that his survey had no reference to any previous reconnaissance or survey. The so-called "Pioneer Highline" lateral is still a myth. It has not and never has had any existence. It consists, even to this day, of a mere speculative line indicated upon a map.

After having left the erroneous impression that the Lake Hattie system was constructed by the original owners of the Pioneer Canal, and, further, that construction of the new inlet canal under the Sevison surveys for the Chicago parties following 1908, was construction on the mythical Pioneer Highline, counsel then seek to take improper advantage of these former random surveys in the following language:

"That their predecessors had made surveys from time to time commencing in 1886 for a canal substantially identical in location with the Pioneer Highline Canal." (76.)

Counsel then allege an 1886 survey reconnaissance made by Lobach and Bellamy, and another in 1897-8 by Roach and Owen, and finally claim benefit of a 1908 survey made by Roach in an entirely different location upon the Laramie Plains.

Excuse for these claims was first alleged by the false assumption of an 1897 priority of claim for the Greeley-Poudre system, which we have previously discussed in connection with the Colorado diversions. There it was shown that no semblance of any such priority claim was made for the Colorado appropriation, and that while on the contrary, August 25, 1902, was the one and only priority date claimed for that enterprise, it best suited plaintiff to contend for an earlier date for Colorado in order that it might have semblance of excuse for claims on the part of The Laramie Water Company's system.

The apparent fallacy of these fictitious claims in the face of

all The Laramie Water Company's permits and appropriations, and the express claims, conditions and limitations of the Pioneer Highline permit, which was never even initiated prior to 1912, should relieve us from giving them further consideration were it not for the fact that by ignoring them injustice may result, and we shall therefore enter upon a somewhat detailed discussion of the record.

All of these disconnected surveys which we shall consider are doubtless immaterial for the following reasons:

(b-1) The Pioneer Highline Canal has never been constructed, either in whole or in part, and was never surveyed until long after the filing of this suit, and any and all previous reconnaissances or surveys of any canal of similar name but by parties foreign to the new enterprise, have no connection with or bearing upon the new lateral of The Laramie Water Company;

(b-2) Claim for such a canal was never filed with the State Engineer of Wyoming and was never presented to the Board of Control or to the District Court during proceedings for the adjudication of water rights on the Big Laramie River in Wyoming, or the review thereof (which terminated in the decree, Plaintiff's Exhibit "N");

(b-3) Any and all claims for a Pioneer Highline Canal, except those represented by permit No. 2719 Enl., filed July 11, 1912, are forever barred by Section 794 of the Compiled Statutes of Wyoming, 1910, requiring all persons to appear and submit their claims for adjudication before the Board of Control of the State of Wyoming; and

(b-4) Because the State of Wyoming and its appropriator, The Laramie Water Company, are bound and limited by the terms of the permit No. 2919 Enl., filed July 11, 1912, and are precluded by the findings and conditions of said permit-decree from asserting any other or different claim for other or different priority from that set forth in said instrument.

We have already discussed at length the conditions and limitations of the permit issued January 8, 1913, and have covered the objections raised in the last of these subdivisions.

We will discuss the first three in their order.

(b-1) No Such Canal Ever Constructed and no Connection Between Recent Permitted Survey and Other Reconnaissances.

Lyman E. Bishop, resident engineer for The Laramie Water Company, came to Laramie in July, 1910. The idea of making a definite survey of the Pioneer Highline Canal seems to have first occurred long subsequent to the filing of this suit. This survey, *in its entirety*, was undertaken by Mr. Bishop and by

no other engineer preceding him. He made both the preliminary and final surveys and certified the application for permit filed with the State Engineer on July 11, 1912. He says:

> "During 1912 * * * made *preliminary and final* location surveys of * * * Pioneer Highline Canal." (774.)

On cross-examination he further says:

> "The Pioneer Highline has been finally located * * * Practically no construction work has been done. The headgate will be * * * located in Lake Hattie Supply Canal No. 1." (785.) (*Not* on the Laramie River or Pioneer Canal, but on the inlet canal to Lake Hattie Reservoir.)
>
> "If the Pioneer Highline Canal is ever built * * * there will be a crossing over the Lake Hattie Supply Canal No. 2 and the Pioneer Highline Canal will be so constructed that Bell Supply No. 2 water could be run into the Pioneer Highline from that point." (795.)

We have already noted that no previous surveys had any connection whatever with the surveys upon which are predicated the various permits and rights obtained by the Laramie Water Company. (661-3.)

The present new 1908 inlet canal to Lake Hattie Reservoir does not follow any of the lines of earlier surveys. (935, 939-40.)

S. C. Downey, a witness for the complainant, described each of these early reconnaissances. He said:

> "The present canal leading to Lake Hattie Reservoir does not follow the line of the survey as shown by the * * * Bellamy or the Owen survey. * * * The topography of the country would naturally throw them somewhat in the same location." (935.)

Of these early surveys he said:

> "I have produced what purports to be a report made by each of four surveyors, d'Hemecourt, Loback, Anderson and Owen.
>
> Each of these was an individual attempt to promote the scheme which I have outlined. Each report is an engineer's prospectus rather than a report on a definite survey basis. By that I would say it is a general report rather than a detailed report of the survey.
>
> *In each of these reports the Highline Canal is quite evidently located at different places*, and in each instance

is a mere open canal without any difficulties of construction.

The High Line ditches, in any event, in order to irrigate lands situated at the higher levels than those irrigated by the Pioneer Canal, *would of necessity be limited in their location between the base of Sheep Mountain and Sodergreen Lake on the Pioneer Canal.* * * *

Any competent engineer, in running any line for the irrigation by a higher line of ditch than the Pioneer canal would be forced to place his line through the vicinity." (939-40.)

After mentioning in detail the several early surveys, he said:

"*The ditch was not built on that survey*" (927) (referring to the d'Hemecourt survey.) * * * "The survey made by Mr. George C. Anderson * * * in 1890 * * * *was independent from the surveys made by d'Hemecourt.* * * * I am not able to produce a plat of the surveys made by Mr. Anderson, I don't believe one was ever made. * * * The ditch was not *constructed* under the Anderson survey." (929-30.)

"I am unable to produce a plat of the survey made by Mr. Loback. *The Anderson and Loback surveys were never filed for record of my knowledge.* * * * *The ditch was not constructed under the Loback survey.*" (929-30.)

The witness then produced Defendants' Exhibits 16 and 17, designated as the Owen and Bellamy surveys respectively, and states:

"*The ditch was not constructed under the Owen survey. It was not constructed under the Bellamy survey.* The Wyoming Central Land & Improvement Company authorized the Owens survey for the Pioneer Canal. The same people authorized the Bellamy survey. This company had four distinct surveys made at different times in this proposed project. The *last* of these four was the Bellamy survey, in 1893." (931.)

He then speaks of certain disconnected surveys subsequent to 1902, having no connection with those made by Sevison or Bishop and no connection with any former surveys by any other engineers, and again speaking of the Owen survey, says:

"The ditch was never constructed * * * as shown by the Owens survey." (933.)

The witness then admitted that the Owens survey and the Bellamy survey were in no way similar except as thrown in a general vicinity by the topography of the country. (933-5.)

We fortunately have the testimony of Mr. Bellamy who made the last of the four original surveys, terminating in 1893. He says:

> "In 1886, Mr. Loback and myself ran a number of lines west of town and over that country. *It was a* mere reconnaissance." (751.)
>
> "Some reconnaissance work was done in 1886, or '87 relative to the Pioneer. *They did not proceed with the construction.* It was simply to see the possibility of sometime running a ditch there. We started with two buggies and I would get out of one, set up the instrument and send the man ahead where I could take a long sweep and sight with my gradient what the fall of the ditch would be, allowing it to run nearly straight and then allow a little and then have him hold the rod with the target the same height as the instrument. Then I would ride to him and he would go on.
>
> We spent two or three days going over the plains between the two rivers." (769.)
>
> "Mr. Loback did the same in '87, only he staked out a line. *No construction was done.*" (769.)
>
> *"The matter was to take a ditch from the Pioneer and run it at a higher elevation with a little less fall.* The Pioneer there has a very heavy fall, in one place, and we thought by coming out ahead of that and around to see how much more he could take in by making a high line of it and picking up waste fall." (769.)
>
> *"In 1893 I had started to stake this out when the panic came on and everything shut down and they dropped it entirely."*
>
> *"There were no filings made* on my original survey which was incomplete." (771.)

The fallacy of any claim of connection between the Bishop-Laramie Water Company—permit of 1912 for the so-called Pioneer Highline and these old surveys is thus exposed by Mr. Bellamy, who was a witness for the State of Wyoming.

> "The present works are entirely disconnected from my surveys and also the '86 and '87 surveys by Mr. Loback and me, which ended in naught. Lake Hattie was not a reservoir in those days." (771.)

According to the testimony of both witnesses Downey and Bellamy, all the earlier surveys went into oblivion and were

practically forgotten and never revived by the Pioneer People. In 1906 or '08, and more than four years subsequent to the commencement of the Greeley-Poudre project in Colorado, engineers Roach and Stewart made certain similar desultory reconnaissance surveys which came to naught. Mr. Roach had assisted Mr. Owens in one of the early surveys which passed into oblivion and states that the 1906 reconnaissance began at a still different point on the Pioneer Canal than that taken by all previous engineers. He says:

> "R. G. Stewart was consulting engineer * * * I had orders either from him or Mr. Corthell" (referring to N. E. Corthell, counsel in this case) *"to go out there and start one or two places and run a line.*
>
> *I ran a line independent of any survey.* I did not run across any surveys made at that time by the original company or their representatives. *I consumed about six days in the field making this survey.*
>
> Mr. Corthell and I had a dispute as to who got the map or plat of this survey. I do not know what became of it." (972.)
>
> I have been unable to give any definite location of my old High Line survey.
>
> *No canal has been built following the line of that survey.*
>
> If the *Lake Hattie supply canal* is correctly shown on the map attached to defendants' answer, then *my line was different.* We started at several places from the Pioneer Canal. I did not tie to anything there, everything was done with angles. * * *
>
> *The present Lake Hattie Supply canal* was built very close to one of my surveys. *It was not built from my survey."* (974-5.)

The applications filed with the State Engineer of Wyoming beginning with April 21, 1908, and upon which permits were granted for the various units of the system now owned and projected by The Laramie Water Company furnish the most conclusive proof that no Pioneer High Line, or any other similar canal, was ever contemplated by the promoters of any of the several units of that system prior to the survey commenced long subsequent to the filing of this suit and immediately preceding the filing of application for permit for the Pioneer Highline lateral on July 11, 1912.

The Statutes of Wyoming (Section 734, Compiled Statutes, 1910, and section 5, Ch. 45, Laws 1895), require:

> *"Each application* for permit to appropriate water for beneficial uses must be accompanied by a *map* or plat

in duplicate, showing accurately the location and extent of the proposed works * * * the course of the river, stream or other source of supply, * * * the *location of the intersection with all other ditches, canals, laterals or reservoirs which are crossed by this work with which connections are made;* and all streams not connected with the proposed work must be represented in ink of different color from that used to represent the proposed work." etc. (3913-14, original record.)

In other words, if any such canal or survey as the Pioneer Highline lateral had been known to Engineer Sevison at the time of making his 1908 survey, or to his successor, or had been seriously contemplated by his employers or any of their successors, including The Laramie Water Company, it would have been proper and *necessary* for Mr. Sevison and succeeding engineers to have noted *on the maps* which accompanied each application for permit the *location of the line and point of intersection* of the canal for which permit was requested, with that of the imaginery Pioneer Highline canal. *Failure to so note the line of this imaginery lateral on any and all of the maps accompanying the several applications for permits is evidence of the fact that such canal was neither known nor contemplated at the time of preparing such maps and filing such applications.*

An inspection of the certified copies of the maps accompanying the several applications so filed (Defendants' Exhibit 159 et seq.) shows that the maps and plats filed with each successive application for permit, from the first (filed April 21, 1908), to and until that for the high line lateral from the new Lake Hattie inlet (not Pioneer Canal), filed July 11, 1912, *are conspicuous for their entire omission of* any notation either by line, words or figures, whereby the slightest inference may be drawn that the Pioneer Highline Canal was ever known or contemplated.

The first permit, No. 8612, filed April 21, 1908 (Defendants' Exhibit 159), shows merely the location of the Lake Hattie Supply or new inlet canal from the river to Lake Hattie Reservoir and the upper contour of the reservoir. At no place on this map portraying in detail the new inlet canal for Lake Hattie Reservoir (which counsel, on page 77 of their brief, erroneously designate the Highline canal) is there any notation indicative of any reference to or connection or intersection with any such Pioneer Highline lateral, real or imaginary, and at no place in the permit or the granting clause thereof is there any reference to any such canal or any permit, filing, survey, claim or application for or on its behalf.

The same observation obtains with relation to permits 8613,

1372 Res., and 1373 Res., for the Lake Hattie Reservoir, and 1939 Enl. for the enlargement of the new inlet canal (permit 8612) from the river to Lake Hattie Reservoir, and the maps accompanying each thereof.

If the Pioneer Highline Canal had been in contemplation on December 5, 1910, the point of crossing and intersection between the new inlet canal from the Little Laramie River to Lake Hattie, known as Lake Hattie Supply Canal No. 2, would undoubtedly have been noted on the map accompanying the application for this canal. An inspection of the map accompanying the application for permit (No. 10363, Defendants' Exhibit 166) reveals the fact that no such point of intersection or crossing is noted and indicates the entire absence of notation of any prospective line of canal situate in the vicinity of or designated as this imaginary lateral. It is apparent that The Laramie Water Company had not, even at that late date conceived the idea of constructing such a lateral, and apparently did not know of its evidentiary possibilities.

Even more positive becomes this conclusion upon examination of the map attached to application for permit No. 2720 Enl. (Defendants' Exhibit 167) applying for right to enlarge this same inlet canal from the Little Laramie River, for even on this map there is no indication of any such canal as the Pioneer Highline Canal, or of any intersection with any canal similarly located.

All these maps confirm and corroborate the evidence of Engineer Bishop, already referred to, that he made both the preliminary and final surveys of the Pioneer High Line lateral during 1912, and not theretofore, and confirms the fact that the idea of constructing this canal is an after-thought, first conceived by The Laramie Water Company and its predecessors during 1912, and long subsequent to the filing of the bill of complaint herein. They likewise confirm the conclusion that the selection of the name "Pioneer Highline" was either a fortunate accident or an unwarranted attempt to capitalize legendary accounts of "visions" of other persons, in nowise bearing upon the new lateral thus so recently projected.

Counsel, on pages 76-7 of their brief, make the erroneous statement that all of the Sevison work, beginning in April, 1908, had some connection with these former and wholly foreign investigations made many years previous by different parties with different interests and objects, and that the construction which commenced in the year 1909 was upon this Highline lateral, when in truth the only construction ever undertaken in this vicinity by The Laramie Water Company or its predecessors was that of the new inlet canal to Lake Hattie, having no relation whatever to any previous ideas of the Pioneer Canal

people and not having in contemplation any extension beyond the point of discharge into the reservoir.

No color of foundation exists for any such assumption. The entire record discloses its fallacy. Even the new lateral permit, the only one ever granted for this or any other Highline canal or lateral, specifically and affirmatively denies their assertion and specifically states that the water to be by it used relates exclusively to the new and not to the old system.

For Wyoming and her appropriators to make such an assertion is as preposterous as would be the assertion or claim by Colorado that her Greeley-Poudre project—in truth commenced August 25, 1902—is nevertheless entitled to assert a claim as of the date of the "wounded deer" incident of Wallis A. Link, to which we have heretofore at length referred, or to assert that she is entitled to priority of the late seventies or early eighties because, perhaps, certain railroad surveys along the Cache la Poudre River included a tunnel for transportation and water diversion at the present location of the Greeley-Poudre tunnel, or, John Zimmerman, of Home, Colorado, made preliminary-survey of this same tunnel line for irrigation diversions, neither of which were ever communicated to Wallis A. Link or A. I. Akin prior to April 25, 1902, but the truth of which they later accidentally discovered. Any such evidence would be fictitious, irrelevant and immaterial and pure sham and its offer improper by reason of the fact that these early acts have no direct bearing upon the Greeley-Poudre project, and could not be legitimately connected with its initiation and construction, even though the early surveys did occupy the exact position of the present tunnel.

Fictitious as any such claims would be, they are on a par with those now solemnly asserted by plaintiff, and are as abandoned and long since completely dead and forgotten as were the early reconnaisances on the mythical Pioneer Highline canal.

Even though the "wounded deer" incident aroused the imagination of Mr. Link, who later initiated the construction of the Greeley-Poudre tunnel, it would be insufficient upon which to predicate a priority constituting the basis and principal value of the title to a great water system. All such early visions, reconnaissances and ideas have some pleasant historical interest, but, like the dreams of inventors or of prospectors seeking for precious metals, are no basis for patent or title, which alone can vest upon open, well-directed efforts, followed with such diligence and compliance with formalities of law as the circumstances and good faith toward other inventors and miners, as well as to the state, may require of those who would thus claim as their own that which theretofore was the property of everybody and yet of none but the sovereign.

We believe further discussion unnecessary to show that the new lateral from the new inlet canals to Lake Hattie, first surveyed in 1912, and whose possibility seems to have been discovered long after the filing of this suit, has nothing in common with any previous reconnaissances made long years since by different persons, at different times, in different localities and with different objects; that it is simply a survey of a mere lateral for carrying water to be diverted from the Big and Little Laramie rivers by new canals constructed since 1908, under authority of new permits, none of them earlier than April 21, 1908, and has no real or imaginary relation to the old Pioneer Canal or its appropriation of water, but on the contrary, is specifically prohibited from carrying any of the same; that it is not to be constructed along the line of or pursuant to any previous survey for any similar canal to carry water of the Pioneer Canal or of any other ditch or stream, but is a new and independent idea in no manner related to any former theories; that the adoption of the name "Pioneer High Line" is a misnomer in that the newly surveyed lateral bears no possible relation to the Pioneer Canal or the carriage of its waters, and that any argument seeking to connect either this lateral or the principal canals, the new Lake Hattie inlets, with the Pioneer Canal or any "early" survey of any lateral line from that canal is wholly unwarranted by the evidence, and cannot conceal the fact that all the new Laramie Water Company's projects are six years and more junior to the Greeley-Poudre project in Colorado.

(b-2 and 3) No Claim of Appropriation for any Such Canal Ever Filed with State Engineer of Wyoming or Made Before the Board of Control or District Court at Adjudication of Priorities on Laramie River.

It is not only necessary under the laws of Wyoming that any person desiring to acquire right to the beneficial use of public water shall make application to the State Engineer for a permit before commencing the construction and enlargement or extension of any ditch or performing any work in connection with any canal (3910. Sec. 724, Comp. Stats. Wyo., 1910), but it is also imperative that such persons thereafter appear before the State Board of Control where the rights of the various claimants to the use of water upon the stream are adjudicated and determined (3917, Sec. 794, Comp. Stats. Wyo.).

The statute reads:

"Whenever the state board of control shall, as provided by law, proceed to adjudicate and determine the

rights of the various claimants to the use of water upon any stream or other body of water, *it shall be the duty of all claimants interested in such stream, to appear and submit proof of their respective appropriations, at the time and in the manner required by law.*"

The same statute then continues:

"*and any such claimant who shall fail to appear* in such proceedings and submit proof of his appropriations shall be barred and estopped from subsequently asserting any rights theretofore acquired upon the stream or other body of water embraced in such proceeding, and *shall be held to have forfeited all rights to the use of said stream theretofore claimed by him.*" (Wyo. S. L. 1901, Chap. 67, Art. 2, Comp. Stats. Wyo., 1910, Section 794).

An adjudication of priorities to the use of water from the Laramie River in Wyoming was had before the Board of Control and an appeal from decision of the board was taken, prosecuted and perfected to final judgment and decree prior to the filing of this suit. (1042, Plaintiff's Exhibit N.)

It accordingly appears that all claims for any "Pioneer High Line Line Canal" must have either been presented at this adjudication proceeding or forever barred and forfeited.

No evidence in this behalf was introduced by Wyoming, and it became necessary to ascertain the truth by thorough search of all official records.

This search (3930-2) revealed:

That no application for permit or filing (other than that made by Engineer Bishop for The Laramie Water Company on July 11, 1912) had ever been filed or made with the State Engineer or Board of Control or other officer of the State of Wyoming for any "Pioneer High Line Canal" or any other similar canal by another name, or for any lateral ditch from the old Pioneer Canal or the new inlet to Lake Hattie for the service of the lands to be served by such a lateral if ever constructed;

That no claim in behalf of any such canal under the name of the "Pioneer High Line Canal" or otherwise had ever been made in the proceedings for the adjudication of priorities of water rights from the Laramie River before the Board of Control or in the proceedings on appeal for review of the decree of the Board of Control to the District Court and terminating in the decree (Plaintiff's Exhibit N); and,

That the application of July 11, 1912, is the first and only filing or claim ever made or asserted of record in behalf of any such a canal or lateral, before any of the officers of the State

of Wyoming having to do with the administration and distribution of the waters of that state.

The above facts are in no way controverted by the complainant and it therefore conclusively appears that no claim for or previous assertion of right in behalf of any such lateral canal was ever made by any person or at time prior to July 11, 1912.

By failure to make any previous claim, The Laramie Water Company and plaintiff state are forever barred from now and here claiming the benefit of any of the disconnected and abandoned previous reconnaissances at length described in the previous section (b).

(b-4) Permit No. 2719, Enl., Filed July 11, 1912, Limits Claims and Bars Assertion of Any Prior Rights.

This topic has been sufficiently discussed at length in the preceding paragraphs. There we observed that by the terms and conditions set forth both in the application filed July 11, 1912, and permit granted January 3, 1913, no claim or assertion is made for use of any water to be diverted from the Big Laramie River by the old Pioneer Canal, but, on the contrary, the only claim made or right granted is for use exclusively of water to be diverted from the Big and Little Laramie Rivers under authority of Permit 8612, filed April 21, 1908, and permits subsequently granted to the Laramie Water Company and its predecessors, and that even as to such, no increased diversion shall be made in excess of that authorized by such recent permits of April 21, 1908, and subsequent.

The appropriator having thus made no assertion or pretense of claim of benefit or advantage of the few desultory investigations with relation to the old Pioneer Canal many years ago and inferentially waived and admitted the worthlessness of any such, and having specifically limited his claim for water to that permitted for diversion six years and more junior to the Greeley-Poudre enterprise, and the plaintiff State of Wyoming having accepted and approved the limitations self-imposed by the appropriator, and having further limited the right to the effect that *the use of this new canal shall "in no way interfere with prior rights on the Big and Little Laramie Rivers"* and that the exclusive function of this new lateral shall be that of carriage (rather than diversion) of a portion of the water so permitted as of 1908 and subsequent, neither the appropriator or the state can now be heard to assert any other or greater rights or privileges than that contained in the application and permit.

(b-5) Conclusions In Re High Line Lateral.

The foregoing exhaustive review of the evidence relative to the mythical High Line Canal, demonstrates:

(1) That no such canal ever has or does now exist;

(2) That the only record claim in behalf of any such canal bearing that or any other name, is for a mere lateral, subsidiary to the new Lake Hattie system and included within the application of July 11, 1912, and not before, and making no claim from the river;

(3) That this new lateral and all other units of the new Lake Hattie system have no connection whatever with any prior reconnaissances made for or on behalf of the Pioneer canal people or for use of appropriations of water of that canal;

(4) That adoption of the name "Pioneer High Line Canal" was a misnomer for that this new survey bears no relation to the old Pioneer Canal or any survey for any high line lateral for use of waters appropriated by it;

(5) That any and all such prior acts relating to the old Pioneer Canal were forgotten and abandoned long prior to April, 1908;

(6) That all appropriations pertinent to the entire new Lake Hattie system, including this new lateral from its inlet ditches, began not earlier than April 21, 1908;

(7) That no claim of appropriation was ever previously recorded or made for or in behalf of any Pioneer High Line canal or lateral or any similar canal by any other name, either with the State Engineer of Wyoming or before the Board of Control or District Court of Wyoming;

(8) That plaintiff is barred by her statutes and by the terms of the permit for the new lateral so designated, from asserting or claiming any benefit of any early investigations looking toward possibility of future construction of some canal in the same general vicinity; and

(9) That the terms and provisions of the permit for this new lateral and the whole record justify the conclusion that all assumptions with relation to this so-called Pioneer High Line Canal are wholly without foundation and in no manner contradict or conceal the fact that all new Wyoming projects are upwards of six years junior to the Greeley-Poudre project in Colorado.

(c) Other Errors.

Among the many other errors appearing in plaintiff's brief, we desire to call attention to the following:

On page 47, counsel state that the appropriators of the plaintiff state had actually used all of the water of the Lar-

amie River prior to the initiation of the Greeley-Poudre project in Colorado, during 1902, which, nevertheless is several years senior to the new projects in Wyoming. The State Engineers and proper authorities of Wyoming disprove this assertion and have granted appropriation to new Wyoming projects for the irrigation of more than 278,000 acres of land in addition to that covered by all ditches prior to the Colorado diversion, and have also granted right for additional storage of 450,000 acre feet of water.

Notwithstanding construction of the large new James Lake and Lake Hattie reservoirs in Wyoming, all of which were initiated long subsequent to the Colorado project, counsel on page 55 of the brief, complain of the fact that they cannot store their surplus water because "the Wyoming appropriators do not have such reservoirs" for their conservation. We are wholly at a loss to understand this statement which is wholly inconsistent with the one last before mentioned. If ditches senior to the 1902 Colorado project had already consumed the water, there would be no surplus in the river and none to be stored. If there was a surplus and the Colorado project had diverted it, it would leave none for the several enormous new reservoirs begun in Wyoming in 1908, and when in turn, these reservoirs have actually been completed and are ready to conserve water, we are at a loss to see where Wyoming can claim that she is short of capacity unless, which we assert, there is more than enough water to supply all appropriations, senior and junior, both in Colorado and Wyoming.

On page 70, it is asserted that Cooper Lake is a natural lake and that its waters do not flow into the Laramie River. James Lake was allowed to continue in just such a condition up to the year 1908-9, when but a slight cut was required to enable the waters, naturally impounded and wasted, to be used for irrigation of lands tributary to the Laramie River. Cooper Lake is quite similar to James Lake, and Wyoming should not be heard to complain when she permits water to flow into this and numerous other natural basins, there to waste and evaporate, when, by slight diligence, the same water could be made available for irrigation.

On page 78, counsel describe the work on the Greeley-Poudre project as "desultory" and point with pride to the rapidity of construction upon the James Lake and Lake Hattie projects. We have already shown that the Lake Hattie reservoir is but the smaller part of the Laramie Water Company's scheme, and that these two reservoirs constitute that portion of the work most easily constructed. We suggest development might be "desultory" when more than thirty years have been consumed in trying to complete the Pioneer and Wheatland projects, and yet only about fifty per cent of the acreage under

either has ever been reclaimed, and when on the Bell Supply canal, quite similar to the Greeley-Poudre project, only fifteen per cent of the work has been completed during a period of five years and none whatever performed on the Bath, Bell, Robinson and McConnell reservoirs. The destruction of the market for bonds of the Greeley-Poudre system by acts of plaintiff and her appropriators might also have some bearing (Camfield, 2163-5; Iliff, 3661-2, 3665-70, 3682-7).

On page 79 it is asserted that 400,000 acres are "now being and proposed to be irrigated in Wyoming under ditches far older than, or at least contemporaneous with the Greeley-Poudre project." The James Lake, Lake Hattie and other new 1907-8 projects in Wyoming are included in the acreage enumerated. Under the rule of priority, a difference of the smallest division of time is sufficient to give superiority. Projects initiated six years junior to another certainly cannot be either "older than" or "at least contemporaneous with" the former projects. This statement is as wholly foreign to the record as the statement on the previous page to the effect that the Lake James and Lake Hattie schemes were commenced before "final plans of the Greeley-Poudre project were made." It will be recalled that the work had been proceeding upon the Greeley-Poudre project, as at present planned, continuously from August 25, 1902, down to and after the time the Greeley-Poudre Irrigation District contract was made in September, 1909, and especially during the year 1907, and it would be just as reasonable to assert that the appropriation for the old Pioneer canal dates as of 1909 or 1910, at which time the Lake Hattie people acquired control of the affairs of the canal in order to enlarge it as it would be to say that the priority of the Colorado project dates from the irrigation district's contract of September, 1909. The Greeley-Poudre Irrigation District simply took over a project which had been in process of construction for more than seven years, and no changes were made in the original plans. Of course, it would be both pleasing and profitable to plaintiff if nothing had been done on the Greeley-Poudre project prior to September, 1909, but we believe that an expenditure of more than $296,000 on a project during six short working seasons is sufficient evidence of diligence to have justified the District Court of Colorado in decreeing priority of August 25, 1902, to the Greeley-Poudre project. Very evidently the new Wyoming projects, all initiated in 1907-8 and subsequent, are neither "far older than" nor "at least contemporaneous with the Greeley-Poudre project."

V. GENERAL CONCLUSIONS.

The following general conclusions may be drawn from the record:

(a) That the Greeley-Poudre project in Colorado, including its tunnel and collection ditches and reservoirs, was initiated August 25, 1902, and that work proceeded with diligence and continued in conformity with well defined plans from that date until prevented by the filing of this suit;

(b) That more than $296,000 had been expended upon the system prior to the Spring of 1908, and that construction had been open, notorious and well known to citizens and officials of Wyoming;

(c) That in Wyoming, surveys first began on the James Lake system March 22, 1908; on the Lake Hattie system April 16, 1908, and on the Sodergreen Highline during November, 1907; that on the Wheatland Industrial Company's projects, while preliminary survey began on the Bordeaux tract in February, 1904, final surveys were made just prior to filing on April 18, 1907, and survey commenced on the Sybille tract in August, 1907, and that none of said or other new Wyoming projects were initiated or work commenced thereupon prior to said dates;

(d) That the Greeley-Poudre project in Colorado is between five and six years senior to any and all of the new larger Wyoming enterprises;

(e) That during 1907 and 1908 and subsequently, new permits have been issued for new enterprises for irrigation of 278,153.61 acres of unreclaimed land in Wyoming and more than 450,000 acre feet appropriations for storage in addition thereto have been granted these new projects, thus initiated, beginning with 1907-8, for all of which new projects the State Engineers of Wyoming have found and thereby declared, that there is ample water after supplying *all* earlier and preferred appropriations on both the Big and Little Laramie Rivers.

(f) That the Greeley-Poudre project in Colorado can do no injury to any senior appropriations in Wyoming and that after diverting but a part of the flow of the one branch of the stream which rises in Colorado, more than ample will remain in the stream to supply the needs (without waste) of both senior and junior appropriators in Wyoming.

VI. WYOMING'S DISREGARD OF COLORADO PRIORITIES.

In concluding the discussion of diversions and use of water from the interstate stream in Colorado and Wyoming, it may

not be amiss to observe that some of the tributaries of the Colorado stream, the Cache la Poudre, have their source in the Green and Laramie mountains along the southerly border of the Laramie Plains in Wyoming and flow out of that State into Colorado, where these waters have long since been appropriated to beneficial use; and that, notwithstanding the prior Colorado diversions, Wyoming has proceeded to officially sanction and decree junior appropriations in Wyoming for irrigation of lands at the headwaters of these interstate streams so arising within her borders. (See map, Plaintiff's Exhibit 1.)

Under the subject of "Inter-watershed Diversions," we discuss at length certain diversions of the waters of Fish Creek, as that stream rises and flows in Wyoming, by which injury is occasioned the earlier Colorado appropriators on the Cache la Poudre, of which Fish Creek is a tributary, and reference is made to that portion of the brief to here avoid unnecessary repetition.

Professor L. G. Carpenter, in his exhaustive discussion of the diversions in the two states, says:

> *"There are instances, other than those I have mentioned from Fish Creek, where citizens and residents of Wyoming are diverting and using waters originating in that state to the detriment and injury of citizens of Colorado.*
>
> There are a great many such diversions on *Crow Creek and Lone Tree Creek in Wyoming*, which are tributaries of the South Platte and have quite a long list of appropriations in Wyoming, and in addition to that, there are a good many appropriations or decrees which have been adjudicated to rights on *Dale Creek*, and various tributaries of the Cache la Poudre other than Fish Creek.
>
> * * * There are a good many rights on Crow Creek for irrigation and other purposes. * * * There are a good many acres that are irrigated from Crow Creek in Wyoming and I know also that in *Colorado Crow Creek has practically no water.*
>
> A number of rights for diversion of water, within Wyoming, from Dale Creek have been granted by authorities of that state. *These rights have been granted and use is made of waters of this creek in Wyoming, notwithstanding shortage of water in the Cache la Poudre river.* * * * Dale Creek is a tributary of the North Poudre and both the North Poudre and the Poudre River have been short of water for a portion of the year for many years. That is especially true of the North Poudre. Dale Creek * * * is a flowing stream throughout its length and the water that is used and taken out in Wyoing undoubtedly depletes the stream in Colorado where

there are existing rights. The adjudicated rights in Wyoming on that stream not only run back for a number of years, but are continually increased, and adjudications are being made from year to year up to the present time. I believe there were some rights adjudicated last year. *By adjudicated I mean certain water rights were quieted and confirmed in owners by the Board of Control of Wyoming, even as late as last year.* I mean users have conformed to laws of Wyoming and their water rights have been so confirmed.

I have in my hand a list of adjudicated rights on Dale Creek and tributaries in the State of Wyoming, obtained from the secretary of the Board of Control of that state. *111 ditches are mentioned in this list of adjudicated rights as having been given decreed water rights out of Dale Creek and tributaries.* This does not include those ditches which have permits but have not gone to final adjudication. There are a good many such permits which have been issued and are outstanding but upon which final proof has not been made.

Diversion of this interstate stream continues in Wyoming notwithstanding shortage on the same stream in Colorado.

Fish Creek is a tributary of Dale Creek and the diversions on the former are included in those just given. On Fish Creek, Wyoming appropriators have not only appropriated water for irrigation of lands within the drainage area of Fish Creek, but even more, they have diverted waters from Fish Creek for irrigation of lands lying outside of its drainage area and in the drainage area of the Laramie River as shown on Defendants' Exhibit 50.

Water is diverted from the Cache la Poudre drainage basin over into the Laramie River basin in Wyoming.

The dam for the reservoir of the water system of the City of Cheyenne, furnishing water for Fort Russell and Cheyenne, was constructed within the last three or four years. Use of water by Fort Russell, I believe has been enlarged and connected. These diversions are from Crow Creek and tributaries. They are from one of the tributaries of the South Fork of the Platte, which tributary joins the South Platte in Colorado at a point a little east of Greeley." (3899-3901.)

It thus appears that while Wyoming would here complain that Colorado, by her *senior* appropriation, is diverting water from the Big Laramie River within her own borders to alleged depletion of water supply which would otherwise be available

to *junior* appropriators from the same stream in Wyoming, she nevertheless has officially permitted, confirmed and decreed *junior* diversions from Dale, Crow and Lone Tree Creeks in Wyoming to the detriment of senior appropriators in Colorado. If the rule of priority of appropriation obtains regardless of state lines, it would follow that the senior Colorado appropriator is doing no violence to the junior Wyoming appropriator whose rights are inferior, and that Wyoming appropriators are only entitled to assert a right to use the residuum of the stream *after* the senior appropriator in Colorado has been fully supplied. But Wyoming is not content to follow the doctrine of priority when the appropriation is made at the headwaters of streams arising within *her* borders, but, on the contrary, deliberately permits her citizens to take Cache la Poudre waters from that portion of its tributaries arising in Wyoming, by means of *junior* ditches, to the *detriment of senior ditches* in Colorado, and quiets, confirms and decrees the right of these late appropriators to continue so to do.

We do not here contend that Colorado has the right to compel the junior Wyoming appropriators to desist from these diversions so injuring senior Colorado appropriators, because the rule of priority of appropriation obtains *only within* the boundaries of each state for the regulation of her own streams in such manner as she may elect, and does not obtain upon interstate streams regardless of state lines, but it would seem that Wyoming should not here complain of the senior Greeley-Poudre diversion from the Laramie River, when Wyoming is not even content to abide an administration of the distribution of water in accordance with the doctrine of priority of appropriation, but officially permits her citizens to violate the rule to the detriment of Colorado appropriators on those portions of the Colorado stream which are in Wyoming.

THE LAW OF APPROPRIATION.

In Volume I of this brief we have considered at length the sovereign rights of each state to exercise supervision and control over the waters within her borders, in such manner as she may elect, and it would seem unnecessary to make another and extended review of the same subject.

Counsel for complainant (pages 94-109) assert that "The universal holding is that priority of appropriation gives priority of right on interstate streams the same as on streams within one state" and cite as authority: Hoge vs. Eaton, 135 Fed., 411; Taylor vs. Hulett, 15 Ida., 265; Conant vs. Deep Creek, etc. Co., 23 Utah, 627; Willey vs. Decker, 11 Wyo., 496; Farm Inv. Co.

vs. Carpenter, 9 Wyo., 110; Howell vs. Johnson, 89 Fed., 556; Anderson vs. Bossman, 140 Fed., 14; Morris vs. Bean, 146 Fed., 423; Bean vs. Morris, 159 Fed., 651; ibid., 221 U. S., 485, and Rickey Land & Cattle Co. vs. Miller, 152 Fed., 11; 218 U. S., 258.

It will be unnecessary for us to enter into a discussion of these cases. In none of them do we find an issue between sovereign states, neither are these decisions in so far as they support the contention of complainant, consistent with the decisions of this court. Two of these cases were certified from the Circuit Court of Appeals to this court: Rickey, etc. vs. Miller and Lux, 218 U. S., 258; Bean vs. Morris, 221 U. S., 485.

The decisions in these two cases in this court have been reviewed in Volume I of this brief. Suffice it to say that in each this court takes a position which is undeniably inconsistent with the doctrine of priority of right regardless of state lines, except upon the assumption that both states assented to an arrangement whereby rights might be acquired by appropriators in one state as against appropriators in another. In Bean vs. Morris, particularly, the court assumes that the upper state, Montana, was willing that such rights might be acquired by appropriators in the lower state, Wyoming. Colorado expressly, by her constitution, her legislation and the decisions of her Supreme Court (Stockman vs. Leddy, 55 Colo., 24), denies to Wyoming appropriators such a right as against appropriators in Colorado. We believe that the cases cited by counsel for the complainant in support of its contention must yield to the decisions of this court in Bean vs. Morris and Rickey vs. Miller and Lux. Furthermore, in Kansas vs. Colorado, 206 U. S., 46, the decision of this court is unquestionably inconsistent with the theory that priority of right, regardless of state lines, is the law. It may be argued that such a question was not directly in issue, but the decision cannot be read as an authority upon any other theory than that each state is sovereign and as such is entitled to the unrestricted diversion and beneficial use of its waters in such manner as it may elect, provided there be an equitable division of benefits, depending upon the circumstances, from an interstate stream.

Furthermore, we find that the Supreme Court of the State of Wyoming has denied to a Colorado user the right of eminent domain for condemnation of a right of way for a ditch heading within the State of Wyoming for the irrigation of lands within the State of Colorado. Grover Irr. Co. vs. Lovella Ditch Co., 21 Wyo., 204, 255-63.

This decision seems to overrule, in part at least, the doctrine announced in the Wyoming and other cases cited by counsel for the complainant.

The cases cited by counsel all involved controversies between individual appropriators in different states and none

of them were between the states in their sovereign capacities. The rights of the citizen in such cases and the limitations of his authority to bind the sovereign, either by his acts or omissions, as well as the rights of the sovereign irrespective of those of the citizen, have been determined by this court:

> Georgia vs. Tennessee Copper Co., 206 U. S., 230.
> Hudson Water Co. vs. McCarter, 209 U. S., 349, 355.
> Kansas vs. Colorado, 185 U. S., 125; 206 U. S., 46.

Each sovereign state stands on an equality with every other state, as announced in Kansas vs. Colorado, *supra:*

> "One cardinal rule, underlying all the relations of the states to each other, is that of equality of right. Each state stands on the same level with all the rest. It can impose its own legislation on no one of the others, and is bound to yield its own views to none."

Colorado was so admitted to the Union. Section 1 of the Enabling Act provides:

> "Which state, when formed, shall be admitted into the Union upon an equal footing with the original states in all respects whatsoever."

If the rights of each state are in all respects equal with those of every other, it follows that any doctrine cannot obtain between the states which denies or does violence to this underlying principle of equality. By neither the common-law doctrine of riparian rights nor the arid region doctrine of appropriation can this equality be maintained in the regulation of irrigation from interstate streams.

The common-law rule is founded upon accident of physical location of lands upon the banks of the streams to the exclusion of all other lands and its application between one state, whose arable lands are non-riparian, and another, whose lands are riparian, must needs deny use of the waters of an interstate stream to the one for the exclusive benefit of the other, and destroy the equal right of the first state to use and enjoy her own natural resources. The same result would follow an interstate application of the doctrine of appropriation for, while the state may, as between her citizens, decree that an absolute inequality shall exist by reason of the fact that only a portion of her lands may be reclaimed by the very limited water supply within her borders, and that he who is first in time shall thereafter be first in exclusive right to the use of the waters of her streams to the extent of his necessities, even though it be to consume all the waters of the stream, nevertheless, the very

inequality and exclusiveness of such a doctrine forbids its application between states with equal sovereign rights, and the rule of inequality which necessity compels between citizens of each state *inter se* cannot apply between states where a contrary rule obtains.

Intra-state Application of Doctrine of Appropriation.

In Part I of this volume, we have given extended consideration to the doctrine of appropriation as applied within, but not between, the arid states of Colorado and Wyoming, while considering the law of inter-watershed diversions. There we discussed the fundamental principles of the doctrine of appropriation as distinguished from the common law rule of riparian rights and the many decisions of this and other courts, including those of Colorado and Wyoming, uniformly declare that the common law rule of riparian rights has been entirely abolished in both Colorado and Wyoming and that each of those states have adopted the arid region doctrine of appropriation for intrastate regulation and control of the streams. A review of the many decisions there cited and quoted is here unnecessary, but a brief reference to some of the rules of application of the doctrine of appropriation may be of some value in construing the testimony introduced respecting the relative priority rights of the appropriators within the two states.

An appropriation is the intent to take the water, accompanied by some open, physical demonstration of the intent, and for some valuable use.

> Fort Morgan Land & Canal Co. vs. South Platte Ditch Co., 18 Colo., 1, 4.

The true test of appropriation of water is the successful application thereof to the beneficial use designed.

> Thomas vs. Guiraud, 6 Colo., 530.

If the construction of a ditch be prosecuted with reasonable diligence, the water right relates back to the time when the first step was taken.

> Sieber vs. Frink, 7 Colo., 148.
> Wheeler vs. Northern Colo. Irr. Co., 10 Colo., 582.
> Kinney on Irrigation, 2nd Ed., Vol. 2, Chap. 40.

The work of construction must be prosecuted with reasonable diligence from the first initial act and until the ditch has been finally completed. The diligence required is that constancy and steadfastness of purpose and labor which is usual

with men engaged in like enterprises and who desire a speedy completion of their plans. As to what constitutes reasonable diligence is a question of fact and must be determined from all the circumstances surrounding each particular case. The *climate* of the part of the country where the appropriation is attempted is a proper subject, upon the question as to whether the work should be prosecuted during all or for only a portion of the year; also the *topography* of the country where the works have to be constructed and through which they run, as to whether the same be level or rough, and whether the soil is easy to work or whether rock and the like are encountered. So, also, may be considered the difficulty of obtaining labor, tools or material and the extent and magnitude of the works themselves. The term "reasonable diligence" is a relative one and what may be reasonable diligence in one case might be a great lack of diligence or unreasonable delay in another, and the fact as to whether there has been reasonable diligence depends upon the facts of each particular case.

Kinney on Irrigation, 2nd Ed., Vol. 2, Chap. 39, pages 1266-83 and cases cited.

While the priority of appropriation relates back to the time when the first step was taken, in Colorado (Sieber vs. Frink, 7 Colo., 140), in Wyoming the priority relates back to the time of the filing of the application for permit with the State Engineer.

Wyo. Comp. Stats. 1910, Sec. 739.
Whalon vs. North Platte Canal etc. Co., 11 Wyo., 313, 344.

The water right of the appropriator is limited both in time and volume by his needs.

Thomas vs. Guiraud, 6 Colo., 530.
White vs. Nuckolls, 49 Colo., 170, 177.

The prior appropriator of water of a certain stream or other source of supply is entitled to the exclusive beneficial use of the water up to the amount embraced in his appropriation, even if it cuts off the right of valid subsequent appropriators and even where this includes all of the water of the stream, and this right continues so long as he applies all of the waters appropriated to some beneficial use or purpose. The water right acquired by a valid, prior appropriation gives the owner thereof an absolute, exclusive property right and he has an absolute right to the use of the water to the full extent of his appropria-

tion and may maintain this right unimpaired by subsequent appropriators of the waters of the stream.

2 Kinney on Irrigation, 2d Ed., Vol. 2, Secs. 780-2, pages 1355-63, and cases cited.

The rights of a prior appropriator being fixed by the extent of his appropriation, others may later appropriate all of the surplus water that is left flowing in the natural stream, provided that no interference with or injury to the rights of the prior appropriator is thereby caused. These later appropriators are termed, under the law, subsequent or junior, and are themselves prior appropriators as regards those whose rights are still subsequent to theirs. Each successive appropriator acquires a right to the surplus water flowing in the stream and each takes all that is required for his needs.

Kinney on Irrigation, 2d Ed., Vol. 2, Sec. 783, pages 1363-6.

If the prior appropriator has no present or immediate need for the full quantity of water which he may divert and use, *he cannot waste it,* but it is his duty to allow such portion as he may have no immediate use for to *remain in the natural stream.*

Burkart vs. Mieberg, 37 Colo., 187, 190;
Nichols vs. Hufford, 21 Wyo., 477, 490;
Kinney on Irrigation, 2d Ed., Vol. 2, Chapter 49, pages 1541-1624.

Water users are not allowed an excessive quantity of water to compensate and counterbalance their neglect or indolence in the preparation of their lands for the successful and economic application of water.

Nichols vs. Hufford, 21 Wyo., 477, 494;
Farmers' Co-operative Ditch Co. vs. Riverside Irr. Dist., 15 Idaho, 525.

Under the doctrine of priority of appropriation, the new 1907-8 Wyoming projects take only whatever surplus remained in the stream after all senior and prior appropriations have been supplied to the extent of their needs (but not for waste), and had the Greeley-Poudre project been in Wyoming, all such new enterprises subsequent to August 25, 1902, would have been junior and inferior thereto and could have no claim upon

the river until after the needs of the Greeley-Poudre system had been satisfied.

Respectfully submitted,

FRED FARRAR,
Attorney General of the State of Colorado.

DELPH E. CARPENTER,
Attorney for The Greeley-Poudre Irrigation District.

JULIUS C. GUNTER,
Attorney for The Laramie Poudre Reservoirs and Irrigation Company.

APPENDIX

LIST OF DEFENDANTS' EXHIBITS.

The complainant's exhibits are designated by the letters of the alphabet. The defendants' exhibits are numbered.

Exhibits:

1. Map of the Laramie and Cache la Poudre Rivers, attached to the answer of the corporate defendants.
2. Map showing irrigated lands, Wheatland, Bordeaux and Sybille tracts.
21. Sketch Map, drainage area of Western States.
22. Sketch Map, Jumna Western and Eastern Canals, India.
23. Map, Punjab Project, India.
24. Map, United Provinces of Agra and Oudh, India.
25. Map, Periyar Project, India.
26. Map, Madras Presidency, India.
27. Map, Bouches du Rhone, France.
28. Map, Carpentras Canal, France.
29. Map, Gap Canal, France.
30. Photograph, Aqueduct, Pont du Gard, France.
31. Photograph, Tunnel, Aqueduct Pont de Gard, France.
32. Photograph, Masonry Aqueduct Craponne Canal, France.
33. Photograph, Aqueduct Carpentras Canal, France.
34. Photograph, Aqueduct Carpentras Canal, France.
35. Sketch Map, Cavour Canal, Italy.
36. Sketch Map, Villoresi Canal, Italy.
37. Sketch Map, White Mud River Project, Canada.
38. Sketch Map, Elbow River Project, Canada.
39. Sketch Map, Red Deer Project, Canada.
40. Photograph, Head-works Cavour Canal, Italy.
41. Photograph, Intake, Cavour Canal.
42. Photograph, Naviglio Grande, Italy.
43. Sketch Map, Strawberry Valley Project, U. S. Reclamation Service, Utah.
44. Map, Milk River Project, Montana.
45. Sketch Map, Los Angeles Aqueduct.
46. Sketch Map, drainage areas, Colorado, Montana, Wyoming.
47. Map, Powder River Project, Wyoming.
48. Map, irrigated land, Powder River Project.
49. Three Sketch Maps, Inter-watershed diversions, Wyoming.
50. Sketch Map, Inter-watershed diversion, Wyoming.
51. Copy of map and statement, Laramie-Poudre Tunnel and collection ditches, filed in office State Engineer, Colo., October 6, 1904.

52-72. Photographs of early work on Greeley-Poudre System on the Laramie River, 1902-1904.

73. Photograph, Skyline Canal.
74. Copy of map and statement, Link Lake Ditch and feeders, filed in State Engineer's office, Colo., Oct. 15, 1902.
75. Copy of map, East Fork Ditch and Reservoir, filed in State Engineer's office, Colo., May 9, 1904.

76-85. Photographs of upper works of Greeley-Poudre System on Laramie River, 1907-1912.

86-104 Blue print diagrams, based on Census Reports, decades 1870 to 1910, inclusive, comparing Larimer and Weld counties, Colorado, with Laramie and Albany counties, Wyoming,—size, population, rural population, agricultural production and live stock.

105. Plat showing minimum temperatures, 1893 to 1912, inclusive, Greeley, Colo., and Laramie, Wyo.

106-112. Photographs showing crop and soil conditions, Laramie Plains, Wyoming.

113. Tabulation, flow of water from Cache la Poudre River to South Platte River, 1909-1913.

Exhibits:

114. Plane table survey plats, Laramie Plains.
115. Album of Photographs of diversion works on Big and Little Laramie Rivers, Laramie Plains, Wyoming.
116. Album of Photographs, farm and ranch improvements, Laramie Plains, Wyoming.
117. Tabulation, irrigated area classified, Little Laramie Valley, Wyoming.
118. Tabulation, irrigated area classified, Big Laramie Valley, Laramie Plains, Wyoming.
119. Album of Photographs. Improvements under Larimer County Canal, Colorado.
120. Album of Photographs, Improvements under Larimer and Weld Canal, Colorado.
121. Album of Photographs, Agricultural Industries, Poudre Valley.
122. Album of Panoramic Photographs, Wheatland and Laramie Plains areas in Wyoming, and Poudre Valley area in Colorado.
123. Table, discharge, Cache la Poudre River at mouth of canon, 1881-1913.
124. Table, discharge, Cache la Poudre at mouth of canon, showing additions and diversions above gauging station.
125. Table, discharge Laramie River at Glendevey, Colo.
126. Table, discharge Laramie River at Decker's and Boswell's (State line).
127. Table, run-off, Laramie River at Wood's Landing, Wyo., and Skyline and Divide Canal diversions.
128. Table, discharge, Laramie River, Wood's Landing, Wyo., 1889-1913.
129. Table, discharge, Laramie River at Boswell's (State line) and Wood's Landing, showing inflow between stations.
130. Maps of irrigated area, Laramie River Valley in Colorado.
131. Table, discharge, Little Laramie River at Hatton, Wyo.
132. Diagram, Laramie River, Skyline Ditch to Wood's Landing, 1912.
133. Diagram showing flow and use, Little Laramie River, Hatton to Two Rivers, Wyo., 1912.
134. Diagram showing flow and use, Laramie River from Two Rivers to Look Out, Wyo., 1912.
135. Mass diagrams, Wheatland Reservoir, Wyoming, 1912.
136. Mass diagram, supply and use, Big and Little Laramie Rivers, 1912.
137. Mass diagram, supply and diversions, Laramie River, Skyline Canal to Wood's Landing, Wyo., 1913.
138. Diagram, supply and use, Little Laramie River, from Fillmore to Two Rivers, 1913.
139. Diagram, Laramie river, supply and use, Two Rivers to Look Out, Wyo., 1913.
140. Mass diagram, Wheatland Reservoir, Wyoming, 1913.
141. Mass diagram, Big and Little Laramie Rivers, supply and use, 1913.
142. Diagram, flow and diversions, Laramie River to State line.
143. Table, discharge, Big Laramie River at Two Rivers, Wyo., 1909-1913.
144. Table, discharge, Little Laramie River at Two Rivers, 1909-1913.
145. Table, discharge, Laramie River at Uva, Wyoming.
146. Tabulation showing sugar beet industry in Colorado.
147-153. Letters to and replies from State Engineers of various Western States, inter-watershed diversions.
154-155. Soil Maps, U. S. Soil Survey, Laramie Plains, Wyo.
156. Photographs showing snow-fall, Medicine Bow Range, Colorado and Wyoming.
157. Chart, discharge, Little Laramie River at Fillmore, Wyo., 1912.
158. Chart, discharge, Laramie River at Boswell's (State line), 1912.
159-178. Certified copies applications and permits for irrigation projects diverting water from the Laramie River in Wyoming, 1908 and subsequent.
179. Copy, Decree adjudicating priorities, Water District No. 48 (Laramie River, Colorado).

NOTE.—Exhibits 3 to 20, inclusive, consist of various data produced on cross-examination by witnesses for the complainant. These were identified but not introduced.

Exhibits 22 to 50, inclusive, show inter-watershed diversions in India, Italy, France, Canada and United States.

SUPPLEMENTAL BRIEF ON BEHALF OF DEFENDANTS

PART II

THE FACTS

(VOL. I OF THE BRIEF DEVOTED TO THE LAW.)

PRELIMINARY STATEMENT.

The State of Wyoming in this cause seeks to enjoin the State of Colorado and its citizens from diverting water from that branch of the Laramie River, an interstate stream, which rises within the borders of Colorado and flows thence into the State of Wyoming, by means of a tunnel to the Cache la Poudre River (the Poudre River) for the irrigation of certain arid lands included within The Greeley-Poudre Irrigation District. The case was submitted upon the briefs and oral argument of counsel for the respective parties in December, 1916. Thereafter the Court entered an order directing that the case be restored to the docket for re-argument. (See Page 10, Vol. 1 of this brief.) It is pursuant to this order that this brief (in two volumes), which we term the "Supplemental Brief" of the defendants, is submitted.

Volume I is devoted to discussion of the law—Volume II, the facts.

The cause is an original proceeding in this court and the evidence is voluminous. In their original brief the defendants endeavored to collect and classify the evidence pertaining to the more important features of the case in order that the court might with less labor reach its conclusions of fact. There is so much local geography involved that we fully appreciate the difficulty of describing in a manner which will be intelligible to a person unfamiliar with the territory, the various features necessary to an understanding of a case of this nature. We have been served with a copy of the brief submitted pursuant to the order of re-argument, by the plaintiff and with due deference to counsel, we respectfully suggest to the court

that our original brief is almost a complete answer to this supplemental brief of the plaintiff, or, to be more exact, this supplemental brief is an attempt to reply to the original brief of the defendants.

It will of course be immediately recognized that Wyoming, the plaintiff in this case, is not suing as an appropriator of water from the Laramie River, but rather as a sovereign state, she sues in behalf of her citizens, some of whom are appropriators from this stream. In other words, she sues in her sovereign capacity and seeks by an action against the sovereign State of Colorado, to control the State of Colorado and her citizens. Conceding, that she has named two corporations as parties defendant, nevertheless her prayer for relief is based upon a broader ground than the acts of these two corporations alone, that is to say, that she recognizes that the citizens of Colorado can be controlled through an action affecting the sovereign state. The case therefore assumes the status which is defined by the language of this Court in the opinion written by Mr. Justice Brewer in Kansas vs. Colorado, 206 U. S., 46-99: "The controversy rises, therefore, above a mere question of local private right and involves a matter of state interest, and must be considered from that standpoint." The plaintiff in its bill of complaint, complains of the diversion of water from the watershed and also complains that prior appropriations in the State of Wyoming will be deprived of water for irrigation if the Colorado diversion be not prohibited.

The defendants proved that the diversion of water from one watershed to another, where necessity required it, was the universal practice where irrigation obtained, and that this practice has been recognized by the law of the

arid states, was followed by the Reclamation Service, and was even in vogue and generally recognized by the law of the State of Wyoming (Page 181 Plaintiffs' Supplemental Brief, also Vol. II, p. 1 to 48 incl. Defendants' Original Brief.)

It is a practice entirely consistent with the theory upon which the doctrine of appropriation is founded. To complain of it in this case and in the same breath insist upon the application of the doctrine of priority as between appropriators of water in the States of Colorado and Wyoming, is, in short, to mix two theories or two legal principles, which are inconsistent and directly opposed one to the other.

In the original brief of the plaintiff, the defendants were at a loss to understand upon what principle the plaintiff relied and after hearing the arguments of counsel we still were unable to distinguish any specific theory of principle upon which the plaintiff based its claim for an injunction against the defendants, prohibiting them from making the diversion of which complaint is made. Since receiving plaintiffs' reply brief, we are still in doubt as to the position taken by Wyoming. On page 189, the concluding statement of the brief contains the following:

> "Second. That there is not here any right in Colorado to a so called equitable diversion of the waters for the purpose of the diversion threatened because (a) the threatened diversion interfering as it does with the Wyoming appropriators and depriving them of necessary water *is contrary to every principle of prior appropriation;* (b) the diversion threatened taking the water as it does from the watershed so that it canont return to the stream is *contrary*

to every principle and doctrnie of riparian rights; (c) that there is no rule or principle governing the depletion of streams *in invitum* excepting the doctrine and principles of prior appropriation and the doctrines and principles of riparian rights and combination of these two, etc."

The defendants, on the other hand, while we answered the bill of complaint to the effect that Colorado as a sovereign state, had the right to the use of the waters rising and flowing within the state, as against the claims of lower states upon the same streams, alleged nevertheless that Colorado and its citizens would not take by means of the diversion complained of, more than an equitable portion of the Laramie River, and that in any event, the diversion sought to be enjoined, was prior in point of time to many large diversions both completed and contemplated, from the same stream in the State of Wyoming. Upon the oral argument, we distinctly stated to the Court, that Colorado's position in this case was that natural barriers prevented Colorado from taking what might be under all facts and circumstances, a reasonable portion of the stream; that we were limited to diversions already existing and not complained of by means of two ditches which had been in operation for many years, of a quantity of water which would average 20,000 acre feet per year, and that by means of the diversion herein sought to be enjoined, we contemplated and additional diversion of 56,000 acre feet, with a possibility that this 56,000 acre feet might be enlarged to 71,000 acre feet; but that the total amount of these diversions, 91,000 acre feet ,was the total average amount which Colorado might make from the Laramie River and that it defined the beneficial use which the State of

Colorado might make of this stream which contributed, or rather, in the absence of these diversions, would annually contribute not less than 250,000 acre feet of water to the State of Wyoming, and that in addition to this supply numerous and important tributaries entered the stream below the boundary line between the two states and further augmented the supply which was available to Wyoming. In other words, we insisted upon the right of the State of Colorado to enjoy the beneficial use of 91/250 of the amount of water which rose within its own borders, or 91/470 of the total supply of the Laramie River in both states. Furthermore we contended that the diversion sought to be restrained, was prior in point of time to many large diversions now existing in the State of Wyoming which had recently been in use, and also prior to many proposed diversions for which permits had been issued by the authorities of the State of Wyoming. We therefore contended that regardless of the principle which may properly control a case of this nature, that the State of Wyoming had failed to sustain her burden and that the case should be dismissed.

Since the argument of this cause, the order of court restoring the case to the docket directs that attention be given to the rule which counsel deem should properly be applied to the solution of this controversy, that is, whether the rights asserted are to be tested and determined solely by the application of the general principles of prior appropriation without regard to state boundaries, or whether, on the contrary, the general principles of prior appropriation are subject to be restricted or their operation limited in this case by state lines, and if so, by what principles, under that assumption, the case is

to be controlled. Volume I of the brief is devoted to a discussion of this portion of the order, and as there concluded, *we respectfully state the contention of the defendants to be, that the doctrine of priority of right in the appropriation of water for irrigation or other purposes, is one of intra state law and has no application in controversies between states, but on the other hand that each state as a sovereign, has the right to utilize the waters of its streams to an extent rendered necessary by the conditions under which the use is made, with just regard for the sovereign rights of the lower states into which the streams may flow; and that this right the state is entitled to in the exercise of its sovereign powers subject to be questioned therefore, in this court in a proper proceeding, as to whether it be reasonably exercising those sovereign powers.* In such a proceeding the Court, sits, as it were, as an international, as well as a domestic tribunal, and applies federal law, state law, and international law, as the exigencies of the particular case may demand: Kansas vs. Colorado, 185 U. S. 125-147.

In Volume I of this brief we have exhaustively discussed the law of state jurisdiction of waters. We there observed that the general doctrine of appropriation like the doctrine of riparian rights, is at best but a rule of usufructuary private property law *intra state* in its application and varying in its interpretation with the laws of the several states in no two of which is the application of the general principles the same. We further observed that the general principles of prior appropriation are such that they cannot apply without regard to state boundaries and are inapplicable to controversies between states; that the doctrine would violate the sovereign rights of states standing upon an equality one with

another; that its application would be to impose an exclusive perpetual servitude upon the natural resources and domain of one state, without consent, for the sole benefit of another state and its citizens and would be equivalent to the taking of property of one sovereignty without compensation or consent, for the exclusive and perpetual benefit of another sovereignty and its citizens; that the general doctrine would be incapable of administration if sought to be applied without regard to state lines and inequitable in its operation; that many of the rivers of the arid region rise in the mountains but disappear as they flow out across the plains and that the enforcement of the doctrine to such streams would be to consume and waste the greater portion of the stream in order to satisfy the claims of the users upon the lower reaches of the watercourse; that on rivers, such as the Colorado, it would be impossible to administer the doctrine and at the same time protect the rights of all the appropriators upon the stream and all its tributaries; that it would be impracticable if not impossible to determine and adjudicate the relative rights of appropriators upon streams irrespective of state lines; that the rights of the appropriator are limited to his necessities, which vary from day to day and year to year and cannot be definitely determined save to fix the maximum amount of his diversion and that such rights are subject to the laws, rules and regulations varying according to the necessities of each particular community where irrigation obtains and that in no two of the communities, districts or states are the conditions and necessities or the laws or rules thereof the same; that any attempt to administer the distribution of waters of interstate streams under the doctrine of appropriaion would involve insurmountable conflict

of laws, rules and regulations and such a variance of conditions as to make its enforcement impracticable; that the conflict of jurisdiction and administration of laws is well illustrated by the waste of water which obtains in Wyoming but is prohibited in Colorado; that administration in such a manner as to obtain the highest use of all the waters of the stream, by exchange and other systems necessary thereto, would be practically impossible; and that the many difficulties and obstacles which confront application of the general principles of appropriation to interstate streams, demand that some other principle must govern controversies between states.

Of the many cases which we discussed we particularly desire consideration of Stockman vs. Leddy, 55 Colo., 24, wherein the position of the State of Colorado is judicially declared by the Supreme Court of the State, and of the two principal cases decided by this Court, Missouri vs. Illinois, 200 U. S., 496, and Kansas vs. Colorado, 206 U. S. 46, wherein the rights of one sovereign state in its relation to another state over the use of rivers common to the two, were determined. We also desire to refer to the case of Rickey Land & Cattle Co. vs. Miller & Lux, 218 U. S. 285, and Bean vs. Morris, 221 U. S. 485, wherein the rights of the states irrespective of the citizens of either are pointed out, especially in cases where, as here, extra-territorial servitudes are denied by both litigant states. We believe that the law announced in *Missouri vs. Illinois* and *Kansas vs. Colorado* should control the decision of this case, that is to say, that each state has a sovereign right to utilize the waters of its streams under such system of law as it may choose and according to its local conditions and necessities either present or future, and that in each controversy between states

all the facts and circumstances are to be so construed as to recognize and preserve the equal sovereign rights of both states and at the same time establish justice between them.

Without further reference to Volume I or further discussion of the law we shall pass to the consideration of the facts here involved.

THAT THE FACTS DISCLOSED BY THE EVIDENCE IN THIS CASE PROVE THAT NO DAMAGE WHATSOVER WILL RESULT TO THE STATE OF WYOMING OR ITS CITIZENS BY REASON OF THE DIVERSION COMPLAINED OF AND THAT THERE WILL REMAIN AN ABUNDANCE OF WATER FOR THE IRRIGATION OF WYOMING LANDS NOW IRRIGATED AND A SURPLUS FOR ADDITIONAL DEVELOPMENT; THAT THE APPROPRIATIONS MADE BY THE GREELEY-POUDRE SYSTEM HEREIN SOUGHT TO BE ENJOINED ARE PRIOR IN TIME AND RIGHT TO MANY VERY LARGE ENTERPRISES, BOTH STARTED AND IN CONTEMPLATION, WITHIN THE STATE OF WYOMING AND DIVERTING WATERS FROM THE SAME STREAM; THAT COLORADO IS, IN ANY EVENT, TAKING LESS THAN A REASONABLE PROPORTION OF THE WATERS OF THAT BRANCH OF THE LARAMIE RIVER WHICH RISES AND FLOWS WITHIN HER BORDERS AND THAT THE EQUITIES ARE ENTIRELY IN FAVOR OF THE DEFENDANTS, BOTH UPON THE FACTS AND THE PRINCIPLES OF LAW INVOLVED, AND THAT THE CASE SHOULD BE DISMISSED.

We believe that under any principle of law which might govern a controversy of this sort, Colorado was entitled to be dismissed for the reason that Wyoming had not shown that she would be damaged by the diversion sought to be restrained, but rather that the evidence proved that even after the total amount capable of being diverted had been taken from the stream for irrigation in Colorado, there was more than a sufficient amount left for the irrigation of the lands now under irrigation in Wyoming and even an abundance of water for future development and though it were contended that it

was questionable as to whether or not sufficient water would remain for the future use of Wyoming, that nevertheless the benefit to the country from the use of this water upon the lands in the Poudre Valley proposed to be irrigated by it, would be many times what it otherwise would be if the diversion were enjoined and the water used for the irrigation of the Laramie plains. We sought to present this case in its broadest possible scope believing that the Court would desire, not the mere academic questions of priority of right or sovereign ownership, but rather that it would wish to know all the circumstances and the probable results which would follow the decision of the case. To that end we reviewed the evidence pertaining to the more important questions presented, and, in that portion reviewed in Volume I of the brief, summed up our conclusions of fact in this manner:

"That the total flow of the Laramie River and its tributaries in both Colorado and Wyoming is something in excess of 470,000 acre feet per annum, and of that amount 431,200 acre feet is the normal average flow of the river available above and including the Wheatland tract.

Of this total flow, Colorado furnishes at least 250,000 acre feet per annum, the evidence varying from 220,000 acre feet according to one Wyoming witness, to 250,000, 300,000 and 320,000 acre feet according to the Colorado witnesses.

Of the 250,000 acre feet furnished by the State of Colorado, we are now diverting for irrigation 20,000 acre feet per annum, and seek to divert 56,000 acre feet in addition, with a probability that at some time this 56,000 acre feet may be enlarged to 71,000 acre feet. Assuming this contingency, Colorado seeks

to divert 91/250 of its own water, and this amount marks the limit to which Colorado can go in the diversion of water from the Laramie River. The rest of the water must for all time remain in the stream for the benefit of Wyoming if she needs it.

That irrigation methods and irrigation systems in Wyoming have been and still are primitive; that necessity has never required the officers of that state to make any definite attempt at the diversion of the water of the stream acording to the respective rights of the appropriators; that wasteful methods have prevailed and still do prevail over a large portion of the Laramie plains area, and that the amount of water used has been far in excess of the amount actually needed, and that Wyoming has most excellent natural storage facilities which have been, to a certain extent, utilized at a remarkably low cost.

That the only expert testifying for the State of Wyoming says that the duty of water on the Laramie plains area is one acre foot per acre.

That the total amount of land under irrigation from the Laramie River and its tributaries in Wyoming is 108,073 acres, including 29,074 acres in the Wheatland tracts and 78,999 acres on the Laramie plains.

That while the Wheatland area is a relatively fair agricultural district, it has an ample water supply for many times the amount of land now under irrigation, and has, in fact, diverted more water than the law of the State of Wyoming permitted or necessity required; that the Laramie plains is an area where climatic conditions are so adverse that its agricultural development has been and will be limited to the production of hay and a few other hardy crops, capable of resisting the severity of the climate.

That the lands of the Greeley-Poudre District are dependent for reclamation upon water from the Laramie River, which, when supplied, will bring about a development within the district equal to the development in the adjacent lands in the Poudre Valley; that the development already reached in the Poudre Valley is one wherein the highest agricultural production obtains, with a possibility of still further development in the future, supporting many times the number of people per unit of area as can be or have been supported by the Laramie plains; that the same quantity of water, applied for irrigation upon the Poudre Valley will produce from five to ten times the amount that could be produced by the application of the same amount of water upon the Laramie plains.

That even, for the sake of argument, assuming a shortage of water in the Wyoming territory effected because of the diversion to the Greeley-Poudre District, nevertheless a far greater benefit to mankind will result from the application of that water in the Poudre Valley rather than upon the Laramie plains.

That after the diversions have been made by Colorado, there will remain available for irrigation in the State of Wyoming in the watershed of the Laramie River, far more than sufficient for its present needs, and even a surplus amount for vast increase in the amount of land under irrigation.

That the prior diversions from the stream, under the laws of the respective states, are in Colorado, and

That the diversion by Colorado from the watershed is consistent with the highest economic use permitted the world over where irrigation is a necessity.

Therefore, the defendants contend that their diversion from the Laramie River into the Poudre by means of the Greeley-Poudre system, will in nowise injure the State of Wyoming, and that the equities between the two states are such that this use is in nowise an unreasonable exercise of the rights of the State of Colorado as a sovereignty."

Defendants' Brief, Vol. 1, pp. 123-125.

We still contend that under the facts as disclosed by the testimony, the suit should be dismissed; and that so far as the merits of this particular case are concerned, Wyoming has failed to make a case upon upon any theory which she might advance.

The evidence relating to the more important features of the case was carefully collated and reviewed in our former brief. The supplemental brief of the plaintiff is largely an answer, to which we will reply by a more condensed review of the evidence with reference to the conclusions which the plaintiff seeks to draw by its supplemental brief.

Questions propounded by certain members of the Court at the argument of this case in December, 1916, suggested that the terms "equitable" or "reasonable amount" did not fix any rule by which the Court could determine this controversy. May we suggest that this principle does not demand any fixed rule, on the contrary, it leaves each case open for determination upon its own merits. Possibly at the moment the question was asked it was not in mind that this is an original proceeding wherein the Court must determine the facts as well as the law. Colorado contended that she is not exceeding her sovereign rights and will not divert more than a reasonable amount of the waters of the Laramie River. No fixed rule could be laid down which will determine

the "reasonable amount" in another case. It is, however, nothing but a question of fact to be determined as any other question of fact.

In the determination of this question of the reasonable exercise of sovereign powers by a state, we believe it pertinent to consider as factors: The development and future possibilities of development in the respective areas affected, and to some degree the relative prioritis of the diversions involved in the different states; the value not only to the persons or localities more directly involved in the controversy but more particularly the value or benefit to the state and its citizens and to all mankind in the application of water to one district rather than to another or, to put it bluntly, to weigh and compare the returns and to consider the highest economic value to which the water can be put; the water supply—this being of course the fundamental question under any principle—and the amount which will remain to the lower state after the diversion complained of has been made; waste or economy of use in the affected areas; the amount of land to be irrigated and what, if any, surplus of water remains; the possibilities of conserving flood waters by available storage; the damage or lack of damage which will be sustained by the respective persons or localities affected, and last, but not least, the effect of a decision upon future controversies wherein the state of facts may radically differ or wherein future development or necessities may prove matters now unknown in the science of irrigation.

It has been said that irrigation does not lend itself to academic treatment. This is true not only from the standpoint of the engineer, but also of the lawyer. The law of irrigation is not yet exact, and probably never will be. It is still in its formative

state. It varies with each state and locality according to prevailing conditions and necessities and will continue to vary with new and future necessities, varying with each state and community. Irrigation statutes have frequently been enacted designed to bring about beneficial results where the conditions contemplated coincide with those in the mind of the legislature, or in other words, where the condition is ideal. But actual conditions in irrigation rarely are ideal, as there are so many influences which affect them one way or another and with such varying results that the application of a statute based upon an ideal condition is difficult indeed, and while the law, like irrigation engineering, is a progressive science applied to varying natural conditions and is gradually developed in the full course of events, there is bound to be and always will be an inability to apply fixed rules for academic treatment. To a great degree each case must be determined upon its own merits.

In our first brief (both volumes) we devoted much time to a review of the evidence, believing that the evidence justified the conclusions of fact which we reached and which, in part, we have reiterated here.

Under the head of "Water Supply" we reviewed the evidence to the effect that the Poudre River did not furnish a sufficient supply of water for the irrigation of lands in the Greeley-Poudre Irrigation District, although that system contemplated the construction of at least one enormous reservoir in the channel of the Poudre River and other smaller reservoirs at available sites; that it was necessary, in order to irrigate these lands, to obtain a supply from some other watershed and that the Laramie River was the only available source of supply of this character.

We contended that the evidence proved that the normal supply of the Laramie River at the State line, including the appropriations now made, is, according to the Wyoming hydrographer, the only witness of the plaintiff upon the subject, 220,000 acre feet, and according to the three Colorado witnesses, is as follows: John E. Field, state engineer, 250,000 acre feet; Charles R. Hedke, 300,000 acre feet; Professor L. G. Carpenter, 320,000 acre feet; and that the total amount of water, including the amount diverted above, in the Laramie River and its tributaries, available for irrigation of lands in Wyoming, including the lands in the Wheatland tract, is more than 431,200 acre feet per annum. If the inflow below the Wheatland diversion be added the total is in excess of 470,000 acre feet per annum. The various investigations and hydrographic data upon which these conclusions were based were carefully reviewed, including this, that the evidence introduced by Wyoming herself showed that in the year 1912, there was stored in four reservoirs alone, that is, Lake James, Wheatland No. 2, Wheatland No. 3 and Lake Hattie, a total of 156,000 acre feet in excess of the use and evaporation from those reservoirs in that year. (3488)

We reviewed the evidence showing the amount of land irrigated in the Poudre valley, approximately 300,000 acres, and in Wyoming 108,073 acres, of which 29,074 acres were in the Wheatland area and 78,999 acres in the Laramie Plains; that the duty of water in the Poudre valley was approximately one acre foot per acre, measured at the headgate of the lateral leading from the canals to the land; that the amount of water heretofore applied on the Wyoming lands was in excess of this amount, although the Wyoming expert, R. I. Meeker, placed

the duty of water on the Laramie Plains at one acre foot per acre, whereas his own measurements showed distributions inconsistent with this statement; that the amount of water applied in the year 1912, for illustration, to the Wheatland lands was 2.6 to 2.7 acre feet per acre, measured at the head of the laterals, and that the amount actually distributed to that tract alone in that year was by 15,000 acre feet in excess of the maximum amount permitted by the laws of Wyoming for the most extreme cases in that State. We reviewed the evidence showing that in the Poudre valley the highest systematized method of administration for the distribution of water and the elimination of waste, had developed; that on the Laramie Plains there was practically no administration whatsoever; that ditches were without adequate means of diversion, that large quantities of water were there annually wasted (1288-9, 2741-3) and the officers of the State as a rule had not been called upon to perform any duties whatsoever concerning the distribution of water according to the priorities; that during the year 1912, concerning which complaint was made by certain witnesses under small ditches, that they were short of water, two large reservoirs on the Laramie Plains, Lake Hattie and Lake James, had continued to store water during the whole irrigation season, and it was proved by the water commissioner that none of these small ditches were so constructed that they could divert water (1276-89). That a comparison, or rather a contrast of the Laramie Plains and the Poudre valley showed that the production available from a like amount of water on the same unit of land was from five to ten times more in the Poudre valley than on the Laramie Plains; that The Greeley-Poudre system was prior in point of time to several large enterprises now constructed in Wyoming, notably the

Lake James system, Lake Hattie system, Sodergreen Highline and the extension of the Wheatland system to the Bordeaux tract and to the Sybille tract (see Part II, Vol. II defendants' orig. brief, and table on p. 228 thereof), of which Lake Hattie has a capacity of 110,500 acre feet, 68,500 acre feet being active or available capacity, and Lake James has a capacity of 41,100 acre feet. That in addition to these, the extension of the Wheatland system called for the irrigation of 10,000 acres in the Bordeaux and 30,000 acres in the Sybille tract; and that other later junior systems were authorized. We also reviewed the evidence showing conclusively that inter-watershed diversions were the rule in all irrigation countries where necessity demanded and economic conditions permitted it. (See Part I, Vol. II, defts. orig. brief.)

The supplemental brief of plaintiff seeks to answer our review of the facts, and in reply to this supplemental brief we shall endeavor to recondense the evidence outlined in our original brief, classifying it in such manner that the Court will be able to consider the various phases of the case separately. We shall follow the order of discussion adopted in plaintiffs' supplemental brief.

I. AMOUNT OF WATER DIVERTED BY COLORADO.

Under the heading, "Amount of Water to be Taken by Colorado," the plaintiff contends that the estimate of the Colorado engineers of the amount of water now diverted by Colorado from the Laramie River is low by at least 6,000 acre feet, and also that the constantly increasing pressure for water in the Poudre valley will certainly cause added efforts to divert water from the Laramie both earlier and later in the season and with less loss, so that even in the

average year the amount diverted by the Greeley-Poudre system would be much more than 75 per cent of the flow of the various streams intercepted by the system (that being the estimate of our engineers), and that the amount diverted would probably be 95,000 acre feet or more, rather than the 91,000 estimated. That in years of low flow, these diversions may amount to 100 per cent of the stream flow at the diversion works.

In order that the Court may understand the situation, let us recall again the geography of the Colorado diversion. The branch or tributary of the Laramie River here involved rises in Colorado in a high mountainous area, flows northerly for a distance of approximately 27 miles to the Colorado-Wyoming line, this length of stream being confined to a high mountain valley averaging from one-half to one mile in width. There are tributary streams entering the river from the east and from the west, more particularly from the west. The Poudre River rises in the same general locality, in fact the small tributary sources of the two streams are interlaced, the real head of the Poudre being Chambers Lake, from which the Poudre runs for a few miles almost parallel with the Laramie, being separated from it by one range of mountains, and then turns almost at right angles and flows easterly.

High on the head waters of both streams a ditch has been constructed and in operation since 1891, known as the Skyline ditch, diverting from some of the headwaters of the Laramie into Chambers Lake, or, in other words, into the Poudre. The testimony shows that this ditch, judging from actual experience, is to be expected to divert about 16,000 acre feet per annum from the Laramie watershed. Another diversion existing for a number of years, called

the Deadman, sometimes the Divide ditch, and at other times the Wilson Supply ditch, diverts water from another tributary of the Laramie River, by a circuitous route, into the Poudre watershed and has and is expected to divert about 4,000 acre feet per annum, making a total of 20,000 acre feet per annum now diverted by Colorado, but by persons not directly complained of in this proceeding. However, in order that we might be justly charged with the benefits which we are endeavoring to derive from this stream, we have in our consideration of this case, charged the State of Colorado with 20,000 acre feet on account of these two diversions.

The plaintiff contends that this is too low by at least 6,000 acre feet, basing this contention upon evidence introduced by the defendants showing the flow of the Poudre River with the accretions through the Skyline and Divide ditches (Ex. 124), and contends that this table shows that in the year 1901, when the normal flow of the Poudre River was 114 per cent of normal, the Skyline alone diverted from the Laramie, 23,801 acre feet; in 1902, when the supply in the Poudre was 51 per cent of normal, the Skyline diverted 22,124 acre feet; in 1903, when the Poudre supply was 116 per cent of normal, the Skyline diverted 26,114 acre feet; in 1904, when the supply of the Poudre was 106 per cent of normal, the Skyline diverted 23,434 acre feet. It was also argued from the record of other isolated years that it appears that the percentage of diversion through the Skyline ditch, assuming, as had been contended by defendants, that the years of high water and low water naturally concur in a large degree on both the Laramie and Poudre rivers, that the Skyline will divert a greater percentage of the supply of the Laramie River in years of low flow than it will in years of high flow.

May we state that the conclusions based upon this table (defendants' Exhibit 124) by plaintiff, appear to us to have been based upon a rather narrow review of the table. It will be noticed, however, commencing with the year 1905, the amount diverted by the Skyline ditch was materially less than the amount diverted in the preceding years, and at least a portion of plaintiff's conclusion is based upon the higher records. The manifest difference in these amounts, which is illustrated by the difference between the years 1904 and 1905, 1904 showing 23,434, and 1905 showing only 13,291 acre feet, diverted by the Skyline, is explained in this, that in the year 1905 Professor Carpenter, then being the state engineer of Colorado, caused this Skyline canal to be re-rated. This re-rating disclosed that the earlier rating had been excessive, the result was that the amount of water which the owners of the Skyline canal were permitted to divert from the Poudre because of the accretion to the stream through the Skyline canal was greatly reduced. Up to the year 1904, the company had been receiving from the Poudre more than it was justly entitled to receive. This was corrected and the table clearly shows a material reduction in the amount of the discharge of the Skyline ditch in the years subsequent to 1904 over what had been credited to that company in prior years. (1431 and 2209.)

There is, however, no nice question of fact involved here. It is conceded that The Greeley-Poudre Irrigation District seeks to obtain as much water as it is possible for it to divert from the Laramie River, inasmuch as all the water available from that source is necessary for the irrigation of the land in the district. This project, costing millions of dollars, was not undertaken because of any whim, but because of absolute necessity, and we, of course, admit the de-

sire and intention upon the part of the Greeley-Poudre District to take as much of this water as circumstances will permit. We do, however, contend that it is impossible to divert more than 74 per cent of the water of the Laramie River flowing at the point of diversion. The reason that we do not contend for 100 per cent of this amount is because it is impossible to obtain it (3424). The collection ditches diverting water from the tributary streams of the Laramie River are situated on the slopes of mountains of very high altitude; they are in every way comparable to the Skyline ditch and the history of that ditch gives us an indication of what will occur on these diversion ditches of the Greeley-Poudre Irrigation System. The Skyline canal is located at an altitude of from 9,300 to 9,500 feet above sea level, along a steep mountain side. (2206) It is impossible to keep the ditch in operation during the winter, and every spring it is necessary to dig a trench through the snow within it. This work is commenced at the lower end and proceeds upward. The ditch is usually open between May 10 and July 1. (2210, 2211) It is therefore apparent that the water, in addition to the heavy amount of seepage from a ditch of this character located as it is, which is not intercepted during the winter months, passes down the stream. The Greeley-Poudre diversion ditches being, as stated, very similar to this, will have a similar history. We therefore believe that the engineers for defendants have not under-estimated the amount of water which has been or will be diverted from the Laramie River for use in Colorado; but assuming for the sake of argument that this contention on the part of Wyoming is correct, nevertheless, as we will show later, it will not make any material difference in the result, because these diversions are made upon the upper

reaches of the stream at a point where the Laramie itself and also the tributaries intercepted are very small streams.

II. AREA OF LAND RECLAIMED.

The Court has requested, in the order for reargument, that the facts showing the extent of the uses of water in both States when the work complained of was begun and when this suit was commenced, be stated.

Inasmuch as the evidence introduced by the plaintiff of the amount of land irrigated and the diversions of water by the various ditches was very general, it is difficult to draw any lines of demarcation as to the extent of the use of water before and after any specific date. The evidence showed the nature and character of the Colorado project, of which complaint is made. The same is true of the lands in the Wheatland tracts, that is, the original Wheatland tract; and also the Sybille and Bordeaux tracts, of a later consideration. On the Laramie Plains there had been such a commingling of projects involving older diversions with the newer systems that we are unable to state with anything even approaching exactness what (for illustration the system of the Laramie Water Company which we generally term the Lake Hattie system) each consists of or includes, nor can we tell what is included within the project which we term the Lake James system. In other words, if these are definite, well defined projects having definite areas or boundaries, the evidence introduced by Wyoming fails to disclose it, and being unacquainted with the history of these developments, these defendants cannot attempt an exact definition of these systems.

We did, however, make a careful survey of a very material portion of the Laramie Plains, mapping or platting this survey in such way that not only were the irrigated lands shown, but also the crops to which these lands were devoted. This survey was made by plane table and a reduced photographic copy of the plats is introduced in evidence. (Exhibit No. 114).

The defendants claim August 25, 1902 as the date of priority of the diversion of water from the Laramie River by means of the Greeley-Poudre tunnel and the collection ditches designed in connection with it. (See defts.' orig. brief, Vol. II, pp. 133-188.) This suit was commenced on May 29, 1911. These, then, are the dates concerning which the Court desires a comparative statement of the development.

The Laramie River valley in Colorado has been frequently described by the witnesses and may be defined as a narrow mountain valley. It was, in part, surveyed in April, 1910, by an engineer named J. A. Whiting, who was introduced as a witness by the plaintiff. This witness described the valley as being from three-quarters to a mile in width, with the irrigated portion consisting of strips of meadow down through this valley on each side of the stream, the irrigated land extending generally 500 to 600 feet from the stream (1267-1271). Whiting made a survey of part of the irrigated land in this valley and found 1,856.64 acres, of which 567.6 acres was land largely covered by willows (1275). A complete survey was also made by Engineer Wortham (3454), employed by The Greeley-Poudre Irrigation District, who made a plat of the irrigated lands along the Laramie river and its tributaries in Colorado, and found a total of 4,250 acres (Exhibit 130).

These lands lying adjacent to the stream, devoted to the production of native hay, are the only lands capable of being irrigated in Colorado within the watershed of the Laramie River. The testimony shows that by reason of their location and the character of the soil, together with the slope, the use of water on these lands is not largely consumptive, but there is a very quick return from irrigation back into the stream; much more than would be true of lands of different character and location (3458). Similar conditions pertain on the upper reaches of the Little Laramie in Wyoming, the region being called the Centennial Valley (1110). This being recognized by both parties to the suit, no charge was made either against Wyoming or Colorado for the irrigation of these areas just described, and the measurements of water had been made as though no such irrigation had been practiced. However, it is pertinent to call attention of the Court to the fact that this insignificant area is all that Colorado can irrigate in the watershed of the Laramie River. Now in order to question the accuracy of the plane table survey made by the defendants of lands on the Laramie Plains in Wyoming, counsel for the plaintiff uses the variance in the amount of land disclosed by the two surveyors mentioned of these Colorado lands, as an argument to the effect that whereas the Wyoming engineer was unfamiliar with the lands irrigated, he failed to find 2,404 acres which the Colorado engineer showed to be irrigated, and that a similar lack of knowledge explained the wide variance between the amounts of irrigated land found by the Colorado survey over the amount claimed to be irrigated by the State of Wyoming in the Laramie Plains.

The argument is not very convincing. In the first place Whiting, the Wyoming engineer who sur-

veyed the Colorado lands, testified that he went only to a point three miles above Glendevey (1270). He also testifies that this same point, Glendevey, is about three miles below the tunnel of the Greeley-Poudre system. In this he was in error. Glendevey is about nine miles below the tunnel (see Exhibits 1 and 130), and it is quite obvious that Mr. Whiting did not make a survey of all the irrigated lands in Colorado. That is not material here, except to show that counsels' argument is not well taken. The incomplete abstract of the record (1266-75) doubtless leads to some confusion. The survey by Engineer Whiting was limited to a certain specific list of ditches, which are set forth on page 1269 of the original record (Vol. III, p. 291), and on page 1275 of the record he says: "I took these certain ditches I mentioned." In other words, Mr. Whiting merely measured the acreage irrigated by the specific ditches set forth on page 1269 and made no attempt to ascertain the total irrigated acreage in the valley.

All of these Colorado lands, that is 4,250 acres, were under irrigation by means of various ditches diverting water from the Laramie River and its Colorado tributaries prior to the initiation of work on the Greeley-Poudre system. So, also, were the diversions hereafter mentioned, made by means of the Skyline canal, which was constructed in 1891-1893 (2206), and the Divide canal or Wilson Supply, constructed somewhat later (1398). Since the work of construction of the Greeley-Poudre system was commenced, there has been no further diversion from the Laramie River within the State of Colorado, although one or two projects subsequently initiated by various persons in Wyoming contemplate not only the construction of a reservoir at Glendevey, but also a reservoir at the State line, neither of which

have been constructed, although a permit was issued for a reservoir at the State line, so far as it lay within the territorial limits of Wyoming (Exhibit 177).

Passing to the consideration of the amount of land irrigated in the Laramie Plains in Wyoming, counsel for plaintiff endeavor to classify it in this manner: (a) Area irrigated under ditches prior to the Colorado diversion (The Greeley-Poudre Irrigation District); (b) Area not yet irrigated but for which rights are claimed under ditches of conceded priority, and (c) areas under ditches of disputed priority. It is of interest, before reviewing this discussion in plaintiff's brief, to note that it is contended that the total amount of land irrigated from the Laramie River in Wyoming is 97,855 acres, from the Little Laramie River 48,344 acres, and from Sand Creek 5,989 acres, or a total of 152,097 acres. (p. 21)

No definite survey or measurement of these lands was made in behalf of Wyoming except as to some isolated areas which will be considered later. However, the defendants did make a survey of most of the irrigated lands—unfortunately time did not permit the completion of this work—and in every instance where lands were testified to be under irrigation by Wyoming witnesses and of which the defendants had made no survey, we accepted without question the Wyoming testimony, and adding these amounts to the amounts shown by the survey, we reached the conclusion that the total amount of land under irrigation in Wyoming is 108,073.75 acres. Counsel for plaintiff in their supplemental brief, giving due credit for good faith in this survey, ingeniously contend that the surveyors not being as familiar with the land, were not as capable of arriving at the true amount under irrigation as are per-

sons familiar with the land, giving as an illustration the failure of their engineer, Mr. Whiting, to find all of the irrigated lands in the Laramie valley in Colorado as before described. But the testimony of Mr. Whiting shows the weakness of this testimony (see pp. 1269, 1275 original record, but not in abstract; also pp. 26-7 *infra*). In the absence of a definite survey, the plaintiff introduced numerous witnesses who testified, not from surveys, but from what purported to be a general knowledge of the irrigated lands under the various ditches, and these statements, although mere rough estimates, are set out against the actual measurements made by defendants' survey.

Let us review very briefly a portion of this Wyoming testimony in order to see how indefinite it is as evidence contradictory to a survey. On page 13 of the supplemental brief it is stated that the amount of land under the Riverside Ditch No. 1, ditch, Riverside Ditch No. 2, and the Caldwell & Gardner ditch is 13,500 acres. This statement is based upon the testimony of a witness named Winkler, a ranchman who had lived in that vicinity for a number of years. He testifies to being acquainted with the Riverside ranch, irrigated by means of these ditches and says the land irrigated by these four ditches was about 13,500 acres (279). And the testimony of a witness Benson, a ranchman, who had also resided in the vicinity for a number of years, and who at one time had been foreman of the Riverside ranch, to the effect that 13,500 acres were irrigated in the Riverside ranch. Neither of these witnesses so much as mention a survey of this land. The testimony was a mere general statement and we do not believe was intended to be a statement of more than a general estimate on behalf of the witness.

It is next contended that the Murphy ditch irrigates about 80 acres. This statement is based upon the testimony of the witness Sodergreen, a ranchman, who also testifies in the same general way, and he also testifies in the same general manner concerning the Last Chance, Fisher and Sodergreen ditches. As to them, he says he irrigated about 800 acres. Concerning the Mansfield ditch, he says it irrigates "near a section" (411). Concerning the Hammond North and South ditches, he says, "it irrigates 160 acres, may be more" (412). Concerning the Smith ditches numbers 1 and 2, he says they irrigate 80 acres (412). Of the Lund ditch, it irrigates "about half a section" (412). Burg's ditch "irrigates perhaps over 200 acres," (413) Central ditch 50 acres; Sodergreen ditches numbers 1 and 2 "irrigate 300 or 400 acres." O. G. ditch "irrigates a section" (415). Sodergreen South ditch, 40 or 50 acres (415). Island ditch irrigates 80 acres (416). The Heidrick ditch irrigates 160 acres (416). Parker ditch irrigates 1,650 acres (416). The Popp & Pahlow irrigates "about 1,120 acres" (418). Sodergreen Highline ditch, built about 1910, "irrigates 4,000 to 5,000 acres" (418). Thus we find that one ranchman, being, according to his own testimony, familiar in a general way with these various ditches and the approximate dates of their construction, makes the statement of the amount of land under irrigation from twenty different ditches; but there is not even an intimation from this witness that he knew of any survey having been made of the amount of lands under irrigation, and his conclusions can be nothing more nor less than a general statement such as would come naturally from a witness familiar in a general way with conditions such as these.

We might review practically all the Wyoming testimony, but the examples which we have just given illustrate all the testimony introduced in this regard, with certain exceptions which we will discuss later.

On pages 15 and 16 of the brief, the Pioneer Canal, being the older of the larger canals on the Laramie Plains, is referred to, and it is said that the superintendent of the canal, a witness by the name of Titus, testified that ten or twelve years before 1913, he had made a map of the irrigated area under this canal which was then 17,000 or 18,000 acres, and that this amount had been irrigated up to the year 1912, when 19,000 to 20,000 acres were irrigated, although the arable area under the canal was from 35,000 to 50,000 acres.

After the defendants had commenced their survey, the engineer, Meeker, who was making various investigations for Wyoming as to water supply, areas, etc., made a reconnaissance of the lands under the Pioneer canal (827). This reconnaissance was made for the purpose of ascertaining more definitely than had been previously done, the amount of land under this canal. The measurements were taken in some instances by pacing the distance, and was not an accurate survey; but this Wyoming expert arrived at the conclusion and testified that the total amount of land under irrigation under the Pioneer canal was 11,556 acres (824, 844), although he said that he found evidence of at least 2,000 acres having been at some time previously irrigated, but not then in use. Contrast these two witnesses for the plaintiff, Titus, the superintendent of the ditch, previously testifying to the amount being from 19,000 to 20,000 acres—and by the way, he was the assistant who later helped Meeker make the measurements—where-

as Meeker, after making his reconnaissance, with Titus' assistance, found only 11,556 acres.

This lack of accuracy merely illustrates our contention that the witnesses as to the amount of land under irrigation in the Laramie Plains were making a most general estimate and their testimony is not conclusive as against a definite survey such as the defendants made. It is further significant, as showing a lack of accuracy, that the decree adjudicating the rights to the use of water from the Laramie River in Wyoming, Exhibit N, to which objection was made by the defendants and which the plaintiff now concedes is not binding or conclusive as against us, decrees the number of acres irrigated under the Pioneer canal as being 49,030, whereas in truth there had never been over 13,500 acres.

The original Wheatland tract comprises 60,000 acres and was initiated in 1884. At the date of taking of testimony, witnesses for Wyoming testified that of this, about 50 per cent was irrigated. The figure was first placed at 33,544 acres in the original tract (168), and 1,004 acres in one of the new tracts known as the Bordeaux tract, this later project including 10,000 acres. But the defendants caused a survey and plat to be made of this area. This plat (defts. Ex. 2), was shown to this same Wyoming witness, who, after examining it, testified that it was substantially correct (195). It shows a total amount under irrigation in the original Wheatland tract and the Bordeaux tract of 28,623.75 acres.

Passing now to the Little Laramie, the plaintiff contends in its supplemental brief that there is irrigated upon that tributary stream a total of 48,344 acres (983). This statement is based upon an estimate of these lands made by the same engineer pre-

viously referred to, Mr. Meeker. However, this amount includes lands irrigated above the point of measurement on the Little Laramie river. It includes the lands in the Centennial valley which we have previously described, for the irrigation of which no charge was made in stream flow against the State of Wyoming. This will be more definitely referred to later.

All this portion of plaintiff's brief appears to be in answer to the discussion of the same subject in the original brief of defendants, where, under the heading, "The Amount of Land Irrigated," commencing on page 68 of volume 1, we discuss at length this subject, and which we will briefly review here. We showed in that discussion that the total amount of land irrigated in the Poudre valley was approximately 300,000 acres. This is not questioned by the plaintiff. We then show that in order to ascertain the total amount of land under irrigation in Wyoming, a plane table survey was made by defendants, commencing at the upper end of the Laramie Plains at a point where the river leaves a narrow canon or valley and enters the high plateau area comprising what is commonly known as the Laramie Plains. This survey proceeded down the stream to a point below the junction of the Big and Little Laramie rivers, thence up the Little Laramie River to the point of measurement on the stream commonly called Filmore. Time did not permit of the completion of the survey of the entire area, consequently, as previously stated, wherever land was testified to be under irrigation which the defendants' survey had not included, the amount of that land was accepted without question in arriving at our conclusions as to the total amount irrigated. The results of this survey were definitely tabulated and are now before

the Court. The major portion of the land surveyed was platted and a photographic reproduction of the plat is in evidence (Exhibit 114). The portion of the survey not platted, includes the irrigated area for about six miles below the point termed Filmore on the Little Laramie River.

It is contended, as we have stated, that this survey, although honestly made, does not compare in accuracy with the statements of witnesses who were familiar with the land. However, the plaintiff endeavored to attack the accuracy of this survey on rebuttal, but apparently was able to find only four instances in which there were any inaccuracies, and these inaccuracies were so slight as to be almost unworthy of notice. In this connection plaintiff introduced in evidence four exhibits, S1, S2, S3 and S4, directed to the plane table survey and the plats thereof in four isolated places; but no additional testimony was introduced which in any wise discredited this survey which counsel for plaintiff had had under consideration for several months. We therefore believe this survey to be a more accurate determination of the irrigated lands than that adopted by plaintiff of introducing testimony of various witnesses who as a rule were only generally familiar with the amount of land irrigated and who did not attempt to base their statements upon surveys, but merely upon rough estimates.

As we have stated, the evidence was not taken with a view of differentiating as to the amount of land under irrigation before or after any particular date, but was designed to show the amount of land under irrigation at the date on which the suit was commenced. On page 34 of the supplemental brief plaintiff concedes that aside from a few small projects enumerated, which are insignificant, the only

Wyoming projects undertaken between 1902 and 1911 are the Bordeaux and Sybille units of the Wheatland tract, the Lake Hattie system, the King ditch and the Hutton lake, the Lake James system and the Sodergreen Highline ditch (see detailed discussion, pp. 198 to 234, Vol. II, defts. orig. brief).

Of these the Bordeaux and Sybille units of the Wheatland tracts are definite. They were apparently an afterthought occasioned by the fact that the Wheatland system had a greater amount of water available for irrigation, particularly from Reservoirs Numbers 1 and 2, than the original Wheatland tract of 60,000 acres, even assuming it to be entirely reclaimed, would require. At any rate, the original surveys of the Bordeaux tract, which includes 10,000 acres, of which only a small portion (1,004 acres according to the contention of the plaintiff), was under irrigation, were stated to have commenced in February of 1904, although application for permit was not filed until April 18, 1907 (3961), and the original surveys for the Sybille tract, which includes 30,000 acres, none of which were irrigated at the date on which testimony was taken, were commenced in August, 1907 (108). These were to be irrigated from water already provided by the Wheatland system.

Then in addition to these was the Lake James system, for which the surveys were begun on March 22, 1908 (638). This reservoir has a capacity of 41,100 acre feet (631), and water had been stored to the capacity of the reservoir (635-636); but we are absolutely unable to learn of any new reclamation which had been made by means of this storage over and above the insignificant acreage which were already under irrigation, although plaintiff contends on page 40 of its brief, "That some 1,500 acres have been irrigated out of this system of which 515 acres

were in tillage in 1913, pp. 991, 992." A reference to this evidence, however, discloses that the witness was talking of lands under what was termed the Talmadge-Buntin project, and the relationship between the Talmadge-Buntin project and Lake James is not explained.

The original surveys for the Lake Hattie system were begun April 16, 1908 (646, 774). This reservoir has a total capacity of 110,500 acre feet, of which only 68,500 acre feet is active or available. We are absolutely unadvised as to the amount of land reclaimed by means of this storage, although water had been stored to the capacity of the reservoir. Plaintiff states in its supplemental brief that 700 acres of new land were irrigated by means of this system in 1913 (p. 39).

The surveys for the Sodergreen Highline ditch were commenced in November, 1907 (445). The capacity of this ditch is not shown, but the owner of it testified that it was built about 1910 and that he irrigated from it 4,000 to 5,000 acres (418). The Hutton Lakes reservoir was a system of reservoirs designed to be filled through the enlargement of an old ditch known as the King ditch. The date of original surveys is not shown, except that it appears that an application was made to the state engineer for a permit on June 3, 1909.

At the date upon which the testimony was taken, it appears that the enlargement of the old King ditch to these Hutton, or sometimes called the Hutton and Creighton, lakes, had never been completed and that no water had been impounded in these reservoirs from this source (284), although the surplus water above the amount actually diverted from Sand Creek instead of flowing through its natural channel into

the Laramie River, flows into these lakes from which there had previously been no means of diversion and from which it wastes by evaporation (321).

It therefore is apparent that of all the land under irrigation in the watershed of the Laramie River in Wyoming, the amount reclaimed since 1902 is merely nominal and that the projects which have been undertaken since that date, of which the more important are these last six above enumerated, are prospective. Development under them is entirely for the future. Therefore, for the consideration of the suggestion of the Court in its order for re-argument, it may be said generally that there has been no reclamation of any material amount of land in Wyoming since the work complained of was begun, and we believe none whatever since this suit was commenced, although, as we will show later, of these new projects Lake James and Lake Hattie both stored enormous quantities of water. If we accept as correct the statement of the plaintiff to the effect that there has been practically no reclamation by either Lake Hattie or Lake James, then the theory which has been consistently advanced by the defendants, that these two reservoirs have been filled or partially filled for several years and that this water has been merely wasted, all to the detriment of other ditches on the Laramie River, is confirmed (see Woodhall 2741-5).

As against the plaintiff's contention that there are 152,097 acres under irrigation in the Laramie watershed in Wyoming, let us review the defendants' evidence upon this point. All the evidence on this question is summarized in our original brief under the head, "Amount of Land Irrigated," commencing at page 68, Volume I. Considering first the Wheatland tract, as we have previously stated, the Wheat-

land tract consisted of an area of 60,000 acres, approximately 50 per cent of which is reclaimed. There is no serious conflict in the testimony concerning the amount of land under irrigation in this tract. M. R. Johnston, for many years superintendent of the company, placed the amount at from 35,000 to 40,000 acres (5). J. A. Elliott, who succeeded Johnston as superintendent, first placed it at 33,544 acres (68). This, however, included 1,004 acres in the subsidiary tract known as the Bordeaux. The defendants platted the area and submitted to Mr. Elliott their map, Exhibit 2, showing a total in the original Wheatland and the Bordeaux tracts of 28,623.75 acres, Elliott testifying that this map "is substantially correct." (195). The second subsidiary tract, called the Sybille, is not yet reclaimed, the ditch leading to it being still incomplete, in that the diversion headgate, laterals and siphons are yet to be constructed (169). Later in this brief we will have occasion to comment upon the apparent relationship between these two subsidiary tracts, that is, the Bordeaux tract, containing 10,000 acres, and the Sybille tract, containing 30,000 acres, to the available water supply which has been provided ostensibly for the irrigation of the original Wheatland tract of 60,000 acres.

Turning now to the Laramie Plains area, we find more difficulty in arriving at the exact acreage under irrigation. The testimony of plaintiff, as we have explained, was very indefinite as to this. Realizing the necessity for accuracy, the defendants undertook the survey which we have described. It commenced at the point on the Laramie River known as Woods Landing, that being the head of the irrigated area on the Laramie Plains area, and ran from this point down the river to a line five miles north of the junction of the Big and Little Laramie and thence

(Ex. 117, pp.

these two statements is explained in part by this: The tabulation made by the Wyoming witness, Meeker, showed that he included lands lying above Filmore, the point of measurement on the Little Laramie River. This means about 11,611 acres, which we contend must not be considered for the reason that the water for the irrigation thereof was not measured or charged to the stream by either party this action, it being, as we have previously described, land similar to the 4,250 acres above the State line in Colorado on the Laramie River, although it will be readily seen that the State of Wyoming gets the better end of this elimination. Nevertheless the situation was tacitly conceded in that manner by both parties to the suit, except as Meeker includes this land in his Exhibit E. However, after eliminating this amount, we find that Meeker's reconnaissance shows 37,942 acres, as against Woodhall's 31,431, but in this Meeker included 2,445 acres on Four Mile and Seven Mile creeks which Woodhall puts into a different classification. The discrepancy, therefore, between the two is 4,156 acres.

Passing now to the Big Laramie, as the Court is already advised, plaintiff attempted no definite survey and offered no definite evidence of the total amount of acreage irrigated. Engineer Meeker made a reconnaissance of the lands irrigated by the Pioneer Canal. This reconnaissance occupied five days. He was assisted by the superintendent of the Pioneer Canal, one Titus, who had previously testified that the amount of land irrigated by the Pioneer Canal was from 19,000 to 20,000 acres. Meeker's reconnaissance was not a survey, measurements being sometimes made by pacing the distance (827). By this method he arrived at the conclusion and testified that the total amount under irrigation under

the Pioneer Canal is 11,556 acres, which is to be contrasted with the previous claims made by his assistant, Titus, and is startling when considered in connection with the decree wherein the appropriation of the Pioneer Canal had been adjudicated, awarding that ditch a priority date of April 19, 1879, for the irrigation of 49,030 acres.

One definite survey seems to have been made by the plaintiff and engineer Sevison testified to the number of acres under the Oasis ditch. The plane table survey did not extend to the extreme limits of irrigation under this ditch, nor to the extreme limits of another ditch known as the Boughton ditch, both of these ditches irrigating lands below the junction of the Big and Little Laramie. Neither does the plane table survey include the Gillespie, Dunn and McGill ditches, which are still further down the river. In reaching their conclusions of the total amount under irrigation, the Colorado engineers accepted as a basis the amount which their survey disclosed, and to this amount was added the amounts as given by the Wyoming witnesses for each tract or parcel of land not included in this survey.

These areas and the locations thereof were carefully checked by the engineers who made the plane table survey (2788), and the conclusion reached that the total amount of land under irrigation in the State of Wyoming from the Laramie river and its tributaries between the Colorado-Wyoming line and the canon of the river below the Laramie Plains was 90,610 acres (2792). But this amount includes the amount shown by Mr. Meeker in his Exhibit E, above Filmore, 11,611 acres, which we insist must be eliminated from consideration, leaving the *net amount on the Laramie Plains below Filmore on the Little Laramie and below Woods Landing on the Big Laramie, irrigated from the Laramie River, including its*

mer on the Little Laramie River.

III. WATER SUPPLY.

This question was the subject of much evidence introduced by both parties. In the main, however, only four witnesses testified concerning the supply of water available for Wyoming lands, one of these, Mr. R. I. Meeker, testified for the plaintiff, the others, Professor Carpenter, Charles R. Hedke, at one time engineer of The Laramie-Poudre Reservoirs and Irrigation Company, and John E. Field, State Engineer of Colorado, were introduced by defendants. We reviewed this evidence exhaustively in our original brief, and inasmuch as nothing will be gained by again reviewing it in its entirety, may we respectfully beg the attention of the Court to this discussion appearing in defendants' brief, volume 1, pages 16 to 68, inclusive. The subject is technical and the sources of information vary, with numerous measurements and other hydrographic data considered.

The defendants in this connection sought primarily to establish the normal flow of the Colorado branch of the Laramie River at the state line. This, of course, would represent the amount of water which Colorado was contributing to the total flow of the river. And, secondarily, to establish the total amount of water in the Laramie River, including its tributaries, available for the whole area, including the Wheatland tract, or in other words, the total flow of the Laramie River and its tributaries measured at a point which would include the diversions for the Wheatland tract. This would include in addition to the flow at the state line, the flow of such tributaries entering the stream in Wyoming as Johnson and Beaver creeks, Sand Creek, Willow Creek, Soldier Creek, the Little Laramie, Four Mile, Five Mile and Cooper creeks, Blue Grass, Sybille and other tribu-

taries and sources of supply within the area mentioned. The tributaries entering the stream in Colorado are of course included in the measurements of the stream at the state line.

No evidence was introduced by the plaintiff seeking to establish definitely the amount of flow of the river, in the presentation of the evidence in chief. However, the one witness upon this subject for the plaintiff, Mr. R. I. Meeker, produced tables purporting to give the flow of the stream at the Pioneer dam. This dam is about nine miles below the state line and about three or four miles below the point known as Woods Landing, where measurements were also taken, Woods Landing being, as we have stated, the head of the Laramie Plains. There are several diversions between Woods Landing and the Pioneer dam, one of which, the Sodergreen Highline, is, according to the contention of the plaintiff, used for the irrigation of from four to five thousand acres. It is therefore apparent that the total flow of the river at the state line is not correctly represented by measurements taken at the Pioneer dam. This witness, Meeker, however, on rebuttal based his conclusions of the total flow of the stream at the state line upon measurements made at the Pioneer dam, as we will show later.

In the presentation of the evidence in chief, Meeker introduced a table, Exhibit B, purporting to give measurements of the flow of the river at the Pioneer dam from April to December, inclusive, in the year 1912, and from January to August 18, 1913. Another table was later substituted for this one, purporting to show additional measurements taken, the second one being Exhibit I, which in turn was supplemented by Exhibit T-7 on rebuttal. On Exhibit T-7, which gives Mr. Meeker's measurements

at the Pioneer dam for the short period of the months of April to December, inclusive, in 1912, all of 1913 and from January to the 15th day of May, 1914, Mr. Meeker has arrived at the conclusion that the run-off of the Laramie River at the Pioneer dam near Woods Landing, Wyoming, January 11 to December 31, 1912, was 207,000 acre feet; run-off at the same place January 1 to November 30, 1913, 109,593 acre feet. The figures showing the monthly discharge upon this table are stated to be, in large measure, the result of actual measurements made by Mr. Meeker. Therefore it is obvious that the diversions above this point both in Colorado and Wyoming, have been deducted, and this is the net flow at the Pioneer dam.

In order to arrive at a conclusion as to the toal amount of water included within the Laramie River flow at this point, there must of necessity be added the amounts of these diversions. We have admitted an average diversion of 20,000 acre feet by the Skyline and Divide ditches. As a matter of fact, in that particular year, it appears from defendants' table, Exhibit 124, that these two ditches diverted 23,143 acre feet, so without including the amount of the Wyoming diversions above the Pioneer dam, the total flow, according to Meeker himself, at the Pioneer dam would be 230,143. We do not intend to overlook the fact that the Wyoming diversions above this point are considerable and must be charged against the flow of the stream. The same allowance must be made in considering the conclusions of the witness concerning the flow for the year 1913.

Much has been said as to what is meant by the term "normal flow." The term "normal" as used is synonymous with the word "average." As we understand it, this is the basis taken by all hydrographers. It is likewise the basis taken for determining the

normal precipitation. It is objected to by the plaintiff, but there can be no misunderstanding of the term. The defendants were endeavoring to ascertain what was the normal or average flow of the stream.

As we have just stated, the only evidence upon this point introduced by the plaintiff was the testimony of Mr. Meeker, and his first two tables, that is, B and I, purporting to give measurements at the Pioneer dam on the Laramie River, which were introduced in evidence during the presentation of the plaintiff's case in chief. The defendants introduced the three witnesses mentioned. It is argued by the plaintiff in the supplemental brief that the evidence given by Mr. Meeker, based upon his own actual measurements, is entitled to greater weight than the evidence of the three Colorado witnesses, the contention being made that of all these three Colorado witnesses, no personal investigations or measurements were made by any of them with the exception of a few taken by Professor Carpenter in the year 1912 (101). This statement, however, is radically at variance with the facts. Professor Carpenter while director of the experiment station at Fort Collins, succeeded in establishing, through the United States Geological Survey, various rating stations on the Laramie River, commencing with the year 1902 (3789-3790). After the Geological Survey ceased taking these measurements, Professor Carpenter furnished an automatic gauge to the water commissioner, Mr. Decker, who continued taking measurements at the state line (3791). Then later Professor Carpenter was employed as consulting engineer by the Greeley-Poudre District and made a report concerning the water supply available for that district based upon a long

series of investigations, including the Poudre and Laramie rivers, supplementing the records previously taken by the United States Geological Survey and by the water commissioner, above mentioned (3933, 3946). These were followed by a long series of measurements by him and his assistants on the Big Laramie and tributary streams in the year 1912, as well as upon the Little Laramie and tributaries (3792). In one of these measurements by Professor Carpenter, it was discovered that there was a very grave error in all the records taken at the state line in this, that at high water, an overflow occurred through certain channels which had not been measured or considered in the previous records (3792 to 3816, 3940, 3946).

These measurements were also supplemented by snow measurements taken under most difficult circumstances on the range of mountains to the west of the Laramie River, which is the chief source of supply of that river and its tributaries. These snow measurements were taken for the purpose of aiding in the stream measurements and also for the purpose of determining the relative supply of Wyoming and Colorado areas (3816, 3824). Two hundred or more observations of the depth of snow on this water-shed were made at different places. Photographs showing these conditions were taken and many of these introduced in evidence. They are contained in Exhibit 156. We respectfully submit that Professor Carpenter was so amply qualified to testify upon this subject, that it is absurd to contrast his qualifications with those of Mr. Meeker, whose conclusions were based, according to his own admission, upon measurements taken in part of the year 1912, all of 1913 and the first three or four months of 1914, and without previous knowledge whatsoever of the Laramie River or the area in controversy.

Charles R. Hedke had been engineer for the construction company, that is, The Laramie Poudre Reservoirs and Irrigation Company and was an irrigation engineer of wide experience (1723 to 1734). He designed and was in charge of the major portion of the engineering work connected with the Greeley-Poudre System and co-operated with Professor Carpenter in 1909 in collecting the data as to the available water supply for the Greeley-Poudre District (1850 to 1853).

John E. Field was State Engineer of Colorado at the time the evidence in this case was taken and had been previously in the employ of the Reclamation Service of the United States Government, and had made numerous investigations on the Laramie River. Still earlier he had been State Engineer of Colorado and also Deputy State Engineer. His duties as State Engineer required him to supervise the distribution of water from the streams of the state and the taking of measurements (1377-1380). His conclusions as to the flow of the Laramie River are based upon an analysis of all stream data pertaining to the Laramie River; measurements taken by the United States Geological Survey, others taken by the State of Colorado, others taken by the State of Wyoming, measurements taken by Professor Carpenter and in fact all sources of information including a critical analysis of the tables and conclusions reached by Mr. Meeker, the Wyoming engineer (3387 to 3453; 3465 to 3510; to 3862).

The conclusions of these three expert witnesses as to the total flow of the Laramie River at the Colorado-Wyoming line, may be given as follows: Professor Carpenter testifies that the amount, after deducting the 20,000 acre feet diverted by means of the Skyline and Divide ditches, is in excess of 300,000

acre feet per annum (3956). Adding the flow of the Skyline and Divide diversions we therefore have according to this expert, testimony that the gross amount of the Laramie River flow at the Colorado-Wyoming line is in excess of 320,000 acre feet per annum. Charles R. Hedke concluded that the total average amount which might be diverted through the Greeley-Poudre System from the Laramie River was 70,000 acre feet per year, that amount being twenty-five per cent of the flow of the river at the state line (1823-1852). Adding to this the 20,000 acre feet diverted by means of the Skyline and Divide ditches the gross amount according to this witness, is 300,000 acre feet at the state line. Mr. Field after making a critical analysis of all records and measurements as above stated, testified that his conservative conclusion from all records is, that the average total flow at the state line, including the Skyline and Divide diversions, will exceed 250,000 acre feet per annum (3477).

These conclusions were based upon so many measurements and upon so much engineering data, that it is extremely difficult to condense the evidence. In fact, it is difficult to understand the details unless one is familiar with not only the circumstances under which the measurements were made, but also the place where the measurements were made and the topography of the country. We have condensed this evidence into narrative form in our original brief. It will be found under the head of "Water Supply", at pages 16 to 68, of volume 1. May we ask that our treatment of the subject there be considered in connection with this supplemental brief.

As we have stated, the Wyoming measurements made by Mr. Meeker from the time he commenced in 1912, were continuous up until the close of the period

devoted to the taking of evidence. On rebuttal Meeker's previous figures were modified, enlarged and in some instances corrected after criticism by the Colorado witnesses, and at almost the close of his testimony, he stated in answer to a question as to his opinion relative to the amount of flow in the years 1912 and 1913 on the Big and Little Laramie:

> "Based on review of the flow records taken in a general way, and other hydrographic information, I have concluded that the year 1912 was slightly above normal in the Laramie River basin, and that, roughly, the normal at Woods Landing station or Pioneer dam is approximately 200,000 acre feet, the year 1913 being a trifle above 50% of normal" (4296).

This conclusion is based upon Meeker's own measurements and yet, according to his Exhibit T-7, the net flow after deducting the Skyline and Divide diversions of 23,143 acre feet and after unknown diversions had been made in Wyoming above his point of measurement, the net amount obtained by him was 207,000 acre feet for the practically normal year of 1912. If 1913 was, according to Meeker, a trifle above 50% of normal, it would then appear that inasmuch as he gives the 1913 flow at the Pioneer dam as being 109,593 acre feet for the period from January 1 to November 30, the normal flow at that point after deducting both the Colorado and Wyoming diversions above, would be in excess of 219,186 acre feet. In that particular year (contrary to the contention made by the plaintiff in their supplemental brief, that in years of low flow more water would be diverted by Colorado from the Laramie

River than in years of high flow), only 14,693 acre feet was diverted by the Skyline and nothing by the Divide Ditch (Exhibit 124). Adding the 14,693 acre feet, we would have according to this basis, 233,879 acre feet as the normal flow of the river at the head of the Pioneer Canal after deducting the unknown amount of the Wyoming diversions above. It therefore appears that the criticism indulged by Mr. Meeker of Mr. Field's conclusions is scarcely justified; neither do we believe that counsel for Wyoming are justified in their attempts to discredit the Colorado witnesses in favor of Mr. Meeker.

It must be born in mind that the amount of the Colorado branch of the Laramie River at the state line, by no means defines the total amount of water available for the irrigation of the Wyoming lands down to and including the Wheatland tracts. The other principal source of supply is the Little Laramie which all witnesses seem to agree carries about one-half the amount of water discharged by the Big Laramie at the state line, according to ratings at or near the station called Filmore, that being the point at which the Little Laramie River emerges from the mountains onto the Laramie Plains. The Wyoming witness, Mr. Meeker, in his table T-8, gives this flow as 93,667 acre feet for the year 1912 and 59,637 acre feet for the year 1913 at this station. It must be borne in mind that in taking measurements of the flow of the Little Laramie, no attempt was made by any witness to charge to the stream the water diverted for the lands above the station, that is, for the irrigation of what is generally called the Centennial Valley (3469). Witness Field concludes that the total flow of the Little Laramie, less diversions above, at or near Filmore, was 120,700 acre feet per annum, as an

average or normal (3472). Hedke did not testify concerning this tributary stream.

In the year 1912, Professor Carpenter in addition to his snow measurements took gaugings of the Little Laramie at Filmore and kept daily records. At that point the drainage area of the Little Laramie is about 163 square miles or 104,000 acres. The run-off for the month of June as found by Professor Carpenter was 76,632 acre feet, and for July, 27,676 acre feet, or a run-off for these two months alone equal to practically one foot in depth for the entire drainage area. In other words, the run-off for June and July alone in the year 1912 amounted practically to 104,000 acre feet (3894). This is to be contrasted with Meeker's statement given in his Exhibit T-8, wherein he says that the total run-off for the entire year 1912 at this point was 93,667 acre feet. Counsel for Wyoming in their Supplemenal Brief conclude that the flow of the Little Laramie as an average is 110,000 acre feet per annum (p. 115).

The witness, Field, summed up all of the data, not alone for the flow of the Big Laramie at Woods Landing, but also all data concerning the river and its tributaries, and he arrived at the conclusion that the *total amount of the normal flow of the stream* after deducting the amount available for all irrigation in Wyoming, including the Wheatland tracts, is in excess of 431,200 acre feet per annum (3476), and that this is by no means the total flow of the river, inasmuch as it does not consider the supply received from a tributary not heretofore mentioned, called the North Laramie, nor from the Chugwater, both of which, however, join the main stream generally below the Wheatland tract. Their water, however, is available for the irrigation of lands lying along them and also for irrigation through a number of ditches

diverting ater from the main stream below that point, incl ling the Cross T. Ditch No. 2, Scissors Ditch, Lar mie River Ditch No. 1, Cross T. Ditch No. 1, A. N Spencer Ditch, Phillips Ditch, Uva Ditch, Yates Ditc McCormick and Bright Ditch, Gallagher Ditch, Rei Ditch, Thompson Ditch, Ryan Ditch and Combinati Ditch. All seepage and return water from the V eatland tract is also available for these ditches. I is to be noted, however, that the lands irri ted by means of these ditches last mentioned re included within the total contended for by W ning (See 17, 18 and 21, Supplemental Brief). If ould seem fair, therefore to include the water of t North Laramie and Chugwater in our calculation

May v refer to the conclusion as to the water supply sta by counsel for Wyoming in their supplemental f. On page 115, they state:

"nual f conclusion is that the average anceed : of the Laramie River is not to exnual 000 acre feet, and the average an-110,00 of the Little Laramie is about constire feet, and that these two sources able f the entire supply of water availthe twe irrigation of the lands served by reams."

And a same page the small tributaries, they say on the

"As creeksatter of fact all of these small small utilized for the irrigation of which dows along them, the area of lands ot included in the tabulation of the ex ated from the Laramie River but dicati of which is indicated by the adjucrees hereinbefore abstracted."

However, these lands on the small tributary streams, insofar as they lie within the general area known as the Laramie Plains, are included within the amount of land which they claim to be irrigated. Note their own brief, wherein on page 21 they tabulate the total amount of irrigated land according to their contention, including "Total irrigated from Sand Creek 5,898 acres. Total irrigated from Little Laramie River 48,344 acres." Then turn back to the bottom of page 18 wherein under the heading, "Ditches from Tributaries", they say: "The area irrigated from Sand Creek and its tributaries under ditches constructed prior to 1902 (p. 902) is 5,898 acres, (pp. 898-9)."

The engineer of the plaintiff determined the irrigated area upon the Little Laramie River *and its tributaries* below the mountains, the mountain ditches not being included, by a reconnoissance made in October, 1913, as follows: The Little Laramie River, 45,899 acres; Seven Mile Creek, 1,527 acres; Four Mile Creek, a tributary of Seven Mile Creek, 918 acres, total 48,344 acres, (pp.982-3). "The lands found to be irrigated are listed in the schedule commencing p. 995." The schedule commencing on page 995 is plaintiff's exhibit E, above referred to and includes not only the lands on Seven Mile and Four Mile Creeks, but also includes, as we have heretofore stated, 11,611 acres lying above Filmore, as an examination by sections and townships of Exhibit E discloses.

It therefore becomes apparent that the plaintiff is seeking to charge against Colorado, the irrigation of lands on tributary streams without making allowance for the inflow from those streams. May we reiterate this is not a suit by individual appropriators. The State of Wyoming is suing the State of

Colorado and we are not concerned with the location of these lands, except that they be within the Laramie River drainage area in Wyoming. Obviously this stream and the land within its watershed cannot be divided to suit the convenience or the argument of counsel. We contend that these Wyoming lands must be treated as a whole and that the total water supply available for them must be considered.

It was ingeniously stated in the original brief filed by the plaintiff at a portion referring to the tributary streams: "As has before been stated, Sand Creek is not in reality a tributary of the Laramie River. A large part of its supply is diverted into the Poudre Valley through the Divide Ditch and the balance is used along its course, so that only in unusual years does any part of its water reach the river." And now, in the supplemental brief we find that there is an admission that in Wyoming 5,898 acres are irrigated from Sand Crek.

This stream is naturally a tributary of the Laramie River and the reason that the waters do not reach the Laramie River, even after the irrigation of the 5,898 acres, is this: All of the water remaining after irrigation above, was diverted from Sand Creek through a ditch known as the Hogue Ditch, thence into a stream called Antelope Creek. The surplus above Hogue's irrigation passed down Antelope Creek into either Creighton or Hutton Lake from which there was no outlet and where the water was merely wasted by evaporation (320-321). This is the same Hutton Lake mentioned as being one of the new Wyoming projects now proposed to be utilized as a reservoir. Upon this statement of facts Wyoming contends that Sand Creek is not a tribuary of the Laramie River.

The plaintiff further contends that theoretical measurements of the Laramie River cannot prevail against the experience of irrigators in that state who testified to a shortage of water (when invariably it was ascertained, upon examination of the witnesses themselves and the water commissioner, that the alleged shortage was occasioned by so-called "two-story" ditches, unable to divert available water, 509-10, 1283-4, 1288-9); that the normal flow of the stream is not a proper criterion of the question, inasmuch as the Wyoming lands cannot be irrigated in years of low flow by water which was available in years of high flow, etc.; that the seasonal distribution of the flow of the river is such that Wyoming must surely be damaged by the Colorado diversion which will be made at a point where the flow is more constantly than it is on the lower river; and that the position of reservoirs by Wyoming for the conservation of flood waters which reservoirs, it is contended, are unprofitable. It is said in the brief: "But no wheat is raised by the use of water that flowed two years ago, and the high flood of 1912 would be of no possible value to the farmer in 1913, unless by the construction of reservoirs, that flow was conserved for use in the subsequent year."

This argument is ingenious. In the first place, what is normal flow of this stream? If Colorado should contend for the maximum flow, obviously Wyoming would have a right to complain at any attempt at a division on this basis. No enterprise could be undertaken based upon the expectation of diverting water according to the flow of abnormally high years. This is clearly explained by Professor Carpenter (3946) a portion of whose testimony is quoted on p. 93 of

Plaintiff's Supplemental Brief. *Had the preliminary discussion of the subject been also quoted,* counsel could not have drawn from it the conclusion they seek. On the other hand, it would be manifestly unfair if the Colorado distribution were to be limited by a consideration alone of the minimum flow. This would overlook the possibilities of procuring water for necessary irrigation during years producing a flow of more than the minimum. No such test would be just, therefore it appears entirely logical that the average flow is the only one which can properly be taken into consideration, unless the defendants be required to refrain from all diversion when the flow of the river is not up to normal. Apparently this is what the plaintiff is contending for. It amounts to this: That they wish to be insured by prohibiting any diversion whatsoever in Colorado, that the minimum flow of the river will be retained. Naturally we do not believe that they are entitled to any such condition. Years of low flow will occur as well as years of high flow, and all irrigators of necessity must take the chances of a short supply of water in occasional years.

The contention of counsel that Colorado by reason of the location of its diversions, is in a better position to insure itself against a low flow than Wyoming appropriators because the stream flow at the point of the Colorado diversions is more uniform throughout the year than lower down, is based upon a fear more imaginary than real. The tunnel itself, as the evidence discloses, diverts water from what are termed the East and West forks of the Big Laramie River, and at the point of diversion this stream is very small. In order to supplement this amount, three collection ditches were designed to bring to the tunnel the water from some of the tributary streams.

The collection ditch on the east, known as he East Side Collection Ditch, taps a tributary of the Laramie known as Deadman, about nine miles below the tunnel and carries the water along the side of the mountain forming the eastern wall of the Laramie valley, up the valley to the tunnel. The West Side Collection Ditch in the same manner taps several small creeks and Rawah Creek, another tributary. This may in time extend to intercept a portion of the waters of a third tributary known as McIntyre Creek. In this manner the estimated 15,000 acre feet is to be added to the 56,000 now contemplated to be diverted through the tunnel. And the Upper Rawah Ditch intercepts waters of the same stream at a higher elevation.

As we have explained, these collection ditches, based upon the history of the Skyline ditch, cannot be operated in the winter time, and all of the winter flow of these tributary streams must pass down into the Laramie (1825 and 3423). Moreover, the engineers in charge of the project, frankly stated that it would be impossible, in the first place to intercept all the water of the tributary streams, and in the second place to convey it through the ditches to the tunnel because of the very heavy loss from ditches located as these are (1664, 1669-1674). This water, though lost to the ditches, contributes to the supply of the river. Furthermore the streams intercepted are merely a small percentage of the total number of tributary streams supplying water to the Laramie River.

The snow investigations taken under the direction of Professor Carpenter and before referred to, were made in part for the purpose of disclosing the relative value as a source of supply of the range of mountains to west of the Laramie River in both states. These investigations disclose that, while a

few of the peaks immediately at the head of the Colorado branch of he Laramie River are somewhat higher than the peaks in Wyoming, nevertheless the precipitation along this range of mountains in Colorado and Wyoming is substantially uniform and the higher elevations at the southerlymost extremities of the Laramie River drainage area are off-set by a greater width of the range in Wyoming (3818-3823; 3883, 3892 and Exhibit 156). The mountain area included within the Laramie River drainage which can be intercepted by the Skyline ditch is only 151½ square miles. The additional drainage which can be intercepted by the Greeley-Poudre system is only 63.5 square miles, whereas the total Laramie River drainage within the State of Colorado is 393 square miles (1398). To the answer of the defendants The Greeley-Poudre Irrigation District and The Laramie Poudre Reservoirs and Irrigation Company, there is attached a large map showing the Laramie River and the Poudre River drainage areas. On this map, which is known as Exhibit 1, the drainage area which can be in part intercepted by the Skyline Ditch is colored yellow and the drainage area which can be intercepted by the Greeley-Poudre system, is colored purple. The total drainage area of the Laramie River in both states is something in excess of 4,000 square miles.

All the stream flow records show what we may term a flood season. This usually occurs in the latter part of May and the first of June. At this stage the streams carry very much more water than at any other period of the year excepting only unusual floods. As a rule this high water comes at a season of the year when irrigation is not yet as urgently needed as later in the season, and any irrigation system based entirely upon the amount of water which

can be diverted during the summer season from streams such as are the Poudre or the Laramie River, will be limited to but a small proportion of what is possible if these flood waters be stored for later use. This is clearly illustrated by the development in the Poudre valley. A number of witnesses testified to this development which is typical of practically all irrigation districts. This development of the Poudre Valley was reviewed by Professor Carpenter at length. He described the conditions prior to 1870 when small ditches applying water close to the river were the rule, stating that at that time, there was under irrigation in the Poudre Valley perhaps 10,000 acres; that in the decade from 1870 to 1880, larger or community ditches were constructed and that the irrigated area was enlarged to possibly 80,000 acres, at which time there was constant complaint of a shortage of water. The witness says at one place: "There was a lack of water under each of these canals in the beginning. There was an acute situation under these canals. The pressure for water was felt at that time. When I first came to Colorado to reside permanently in 1888, the situation was more acute than it has been since." The fourth period of development which the witness describes as being that of reservoir construction, started about 1880 and has continued up to the present day. With the construction of reservoirs came the effort to obtain water where available from other watersheds. In 1890 there was perhaps 135,000 acres irrigated in the Poudre Valley. This amount has increased until today there is approximately 300,000 acres. (See testimony of Professor Carpenter 2259 to 2294). Similar testimony was given by the witness John L. Armstrong who had been for many years water commissioner of Water District No. 3, of Colorado, which

includes the Poudre Valley. He describes at length the irrigation system which has been developed in that area; the method of exchange between reservoirs and ditches in order to secure the highest possible use of the available water and the wonderful returns accomplished by agriculture under irrigation in that valley (2454, 2584). In the year 1912, the total amount of storage capacity in these reservoirs of the Poudre Valley was 146,665 acre feet (3721), This is much less than the aggregate capacity of the Wyoming reservoirs. It is apparent that the storage of water in these reservoirs coupled with the more systematic method of distribution accomplished largely by the practice of exchanging between ditch and reservoir and between reservoir and reservoir in order to secure the most advantageous use of the available water, has resulted in the irrigation of approximately one-half of the land now irrigated in the Poudre Valley with less complaint between the various users of water and with less danger from a shortage in the supply. But the Poudre River supply has been so diminished that more water must now be obtained from other streams.

The Laramie River area in Wyoming is more fortunate in its storage facilities than the Poudre Valley. The country being in part mountainous, lends itself to reservoir construction at very little expense. It is of interest to note the capacity of some of the reservoirs mentioned in the evidence. The Wheatland system has two, one situated near the center of the original Wheatland tract, known as Wheatland Reservoir No. 1. This reservoir can receive water from the Laramie River through the tunnel diverting water from that river into Blue Grass Creek, thence into the Sybille, from which it is diverted by the ditches of that system. In addition to

this source of supply it is able to receive water flowing naturally in both Blue Grass and Sybille creeks. The capacity of the reservoir is 7,000 acre feet (166). Wheatland Reservoir No. 2, is a channel reservoir located just above the canon where the Laramie River passes through the range of mountains forming the eastern edge of the Laramie Plains. It has a capacity, according to the survey thereof on file in the State of Wyoming and according to the witnesses introduced for the State of Wyoming (particularly M. R. Johnston, for many years superintendent of the system), of 126,000 acre feet (6, 66), although the hydrographer for the State of Wyoming, Mr. R. I. Meeker, by his own process of reasoning, places its capacity at 83,400 acre feet (4309). We understand that there was a controversy in the adjudication proceedings resulting in the decree on the Laramie River, between the owners of the Wheatland Reservoir No. 2 and the owners of Lake Hattie. Mr. Meeker was an employee of the latter and was primarily engaged in an investigation of the Laramie Plains area and we believe that his determination of the capacity of the reservoir at 83,400 acre feet, the same being materially less than the capacity established by the survey of the reservoir by the owners thereof, was due to the fact that according to his tables of stream flow, he did not have a sufficient amount of water with which to account for the capacity of 126,000 acre feet, although it is admitted that this reservoir has not only been filled many years, but at times escaped destruction only by a narrow margin because of the surplus amount of water coming down the river which of necessity entered the reservoir because of its location, the dam being across the river channel. By this statement we do not desire to be understood as

challenging Mr. Meeker's honesty. We feel rather that he was so impressed with the accuracy of his own measurements of stream flow that he felt the capacity of the reservoir must be less than shown by the survey, otherwise he could not account for the extra amount of water stored in it. In the original brief filed by the plaintiff, it is interesting to note the attempt to explain the discrepancy upon the theory that 83,400 acre feet was the active capacity, the remainder being inactive or unavailable storage (p. 20). There is not, however, a suggestion in the testimony of any witness that any material portion of the 126,000 acre feet in this reservoir was inactive or unavailable. In their supplemental brief, counsel say on page 78: "The Wheatland project has had the advantage of a reservoir with a capacity of more than 80,000 acre feet."

The next reservoir which we wish to consider, is Lake James, with a capacity, according to Wyoming testimony, of 41,100 acre feet (632), and the fourth, Lake Hattie, with a capacity, according to Wyoming testimony, of 110,500 acre feet of which 42,000 acre feet is inactive or unavailable, leaving 68,500 acre feet available to be withdrawn from the reservoir (786,787). Lake Hattie is so situated as to be able to receive water from both the Big and Little Laramie Rivers. Both enterprises have been constructed since 1908. There was no controversy between the various interested parties in Wyoming as to the capacity of Lake Hattie and Lake James.

There are other reservoirs besides these which we will not take the time to consider, but these four alone have a total active capacity of 242,600 acre feet, almost 100,000 acre feet more than the combined capacity of all reservoirs in the Poudre Valley (3921).

The plaintiff in its supplemental brief has very kindly given us some intimation of the cost of construction of a portion of the system for the irrigation of the Wheatland tracts. It is stated on page 17 of the brief that the expenditure prior to 1902 on Reservoir No. 2, was $115,541.56. We are not given any intimation concerning the cost of Reservoir No. 1, but inasmuch as Reservoir No. 2 is the larger reservoir with the capacity of 126,000 acre feet, it is apparent that this reservoir, exclusive of the diversion system, cost less than $1.00 per acre foot of storage. This cost, in comparison with either large or small reservoirs throughout all the irrigated sections of the country, is merely nominal. This reservoir was built, according to the contention of the plaintiff, to furnish water to the settlers on the original Wheatland tract at a time when, although only a small portion of the tract was irrigated, complaint was made that there was a shortage of water in the direct flow of the stream. In the face of this illustration, Wyoming contends that the construction of reservoirs for the stortage of flood waters is not profitable in Wyoming; in other words contending that they do not have a sure and certain supply for their early appropriations from the Laramie River (which in itself is contradicted by their own contention and which supply will not be interferred with by the diversions in Colorado), but that they are not called upon to spend money for the purpose of conserving flood waters. Now, which is correct? Did they have a sure and certain supply without storing, or not? If they did, why were these reservoirs built?

So important to the whole country is the conservation of flood water supply and winter flow in all irrigated areas—and of this the Court will take judicial notice—that immense sums of money have

been expended in the construction of reservoirs. Some of those of the United States Reclamation Service need only be brought to the attention of the Court. For illustration, that enormous reservoir constructed on the Rio Grande, commonly known as the Eagle or Elephant Butte Reservoir, with a capacity so great as to be astounding, it being given as high as 2,638,860 acre feet, for the construction of which, together with the diversion system under it, $10,000,000 was appropriated; the Pathfinder reservoir on the North Platte River in Wyoming, impounding approximately 1,070,000 acre feet; the Roosevelt reservoir on Salt River in Arizona, capacity of 1,367,300 acre feet; the Shoshone reservoir in northern Wyoming, capacity 456,600 acre feet, and many others, both government and private projects which might be mentioned. Why were these reservoirs constructed? Why the expenditure of enormous sums of money in this manner? Obviously for the purpose of impounding flood and other waters in order that the needs of mankind might be supplied through the food which is produced upon the areas brought under cultivation by the use of this water for irrigation. To argue that reservoirs are unprofitable, except possibly under peculiar conditions, is to admit, either that there is a surplus of water for the irrigation of the area in question and that the low flow of the stream in itself is sufficient for this purpose, or that the returns from the irrigation of these lands is not sufficient to justify the expense. That can be true only where the lands are not suited for agriculture. The conservation of the natural resources of the country demands that flood waters be impounded and that these impounded waters be made to perform their natural duty in the irrigation of land in order that our people may be fed.

The plaintiff further contends that the Wyoming prior appropriators have already experienced a shortage in water, which any diversion by Colorado will necessarily increase, citing the evidence of several witnesses, under some of the smaller ditches on the Laramie Plains which the water commissioner says are "two-story" ditches—too high to draw water (1282-4, 1288-9), which is also admitted by the witnesses (509-13), and also the statement that even since the construction of the Wheatland reservoir, farmers under that reservoir have not had as much water as they wanted. It is argued that regardless of the normal flow of the stream and the duty of the water, that the condition thus established by the actual experience of these irrigators proves that the water in the stream has already been appropriated in Wyoming. It is not surprising that individual users of water occasionally find themselves without adequate supply—more frequently without what they consider an adequate supply—for it is the experience of all irrigators that there is a tendency on the part of farmers, particularly those new to irrigation, to seek to apply more water than is reasonably required (2322-2324 and 2497). We have heretofore shown that as early as 1880, when there was only 80,000 acres of land irrigated in the Poudre valley, there was frequent complaint of lack of water (2280 and 1403), and it was thought that the limit had been reached in the reclamation of that area. Later development has shown conclusively that there was not a general shortage of water at that time, nor was the ultimate reclamation attained. More systematic methods of distribution with more adequate means of diversion and storage of flood and winter waters has brought further reclamation. As the evidence in this case, more particularly the various

tables of st ow, discloses all of the streams, such as the e and the Laramie Rivers, are low during t summer and fall and if that flow alone be dep upon for irrigation, then the area must be lim very narrow margins. It is not surprising ome individual appropriator or some indiv ditch may have experienced a shortage of w That is to be expected, particularly in view of th that some of these witnesses referred to in iff's supplemental brief admitted that their dit ould not divert water owing to the fact that the re "two-story" (1282-4, 1288-9, 509-13) and ed to conditions in the year 1913, which, accord to the Wyoming witness, Meeker, was a year of tly more than 50 per cent of normal stream fn the Laramie River. Moreover, there were v ew ditches in the Laramie Plains with adequate ans of diversion. These systems were of the m rimitive construction. Dams were made as occa required them, constructed frequently of pil manure, rubbish, brush wood or any other ava le material. Headgates are testified to as bei bove the bottom of the river bed. In fact, with exception of a few of the newer projects, a mo rimitive system of diversion works could hardly magined. So deficient were these diversion work hat defendants caused photographs to be taken each one on the Laramie Plains, with the excepn of two or three which could not be found (Exhit 115). This set of photographs shows more clely than we can describe the conditions prevail there.

If Wyomi experienced a shortage of water, it is remarkab that no definite system of distribution by adinistrative officers has been followed. The sitation is well illustrated by a state-

ment made by the witness, M. R. Johnston, superintendent for some time of the Wheatland system. In speaking of the diversion dam by means of which the water is diverted from the river into the tunnel of that system, he said: "We aimed to take about all we could get, except what filtered through. Of course, we had to let some go down when the fellows below on the river 'hollered' too loud, be we aimed to use most of the water. Never knew the water to run over the top of the diversion dam except in cases of water-spouts on one or two or three occasions."

The law of Wyoming, similar to the law of Colorado, provides for an officer termed the State Engineer, who has general jurisdiction of this matter. Immediately under him are the superintendents of irrigation, called Division Engineers in Colorado, and under the superintendents are the water commissioners, who have jurisdiction over the irrigation districts. The plaintiff placed upon the stand Mortimer N. Grant, a witness who had been water commissioner in the district including the Laramie Plains in Wyoming. His testimony appears at pages 1276 to 1289, and was so conclusive of the contentions made by the defendants that the diversion systems in Wyoming were of the most primitive sort and that there was no definite administration of the water there, that this testimony was set out in full in our original brief (pages 95 to 99). It may be summarized as follows: Witness was water commissioner in the year 1913 on the Big and Little Laramies and their tributaries; that complaints were made about water in that year in the latter part of May or the first of June, by The Wyoming Development Company (the owner of the Wheatland Reservoir), and complaints were made about July and August by four or five ranchmen. Considerable

trouble was encountered in distributing the waters of the Little Laramie because of the low flow. During July and August the witness made trips from his headquarters at Laramie, going up the Little Laramie, thence crossing over and down the Big Laramie, making possibly seven round trips. There was one complaint made against Lake Hattie. The witness testifies further that in 1912 a man named Wilson was acting as water commissioner on the Little Laramie. He understood there was a commissioner on the Big Laramie, but iddn't know the person; that previous to 1912 there had been water commissioners appointed, but they had "never been out in the field to amount to anything. The water commissioner as a rule only goes out in the field when called." The witness states further that it is the practice all over the State for water commissioners to act only when complaint is made. He describes the inadequacy of the diversion systems and lack of measuring weirs, testifying that the ditches had to be rated with the use of a current meter; that most of the ditches on the Big Laramie River were above the bottom of the stream; in high water they got all the water they needed, at low stages a dam is required. "At such times the user goes to the head and throws some obstruction into the stream to suit his desires," which the high water flow washes out. "On both the Big and Little Laramie rivers it is practically physically impossible for any water commissioner to properly apportion the waters with the appliances that exist at the present time. * * * Everything is so crude on both rivers that an apportionment according to the legal rights of the parties is practically out of the question, unless one has a current meter to measure it, and then it is a matter of a good deal of labor to try to regulate the water.

ating consumes considerable time and ex-
Each rating c So that for the orderly administration of that
pense. So tha upply the conditions are not there."
water supply Elliott, the superintendent of the Wheatland

Mr. Elliot testified that none of the officers of the State
system, testifi ming had ever interfered with the Wheatland
of Wyoming storage or distribution of water (194). Al-
in the storag his predecessor, Mr. Johnston testified that
though his p ear 1911 the Wheatland people had been re-
in the year 1 to allow some water to pass their diversion
quired to all t is therefore apparent that if any shortage

James, th bout April 21 and ceased August 3. Now
menced a 1912 was a year of practically normal flow.
the year 1

It is the year concerning during which some of the witnesses complained that they were short of water, nevertheless these two large and junior reservoirs continued to store throughout the irrigation season and apparently no complaint was made against them, at any rate, they were not interfered with. In the year 1913, that being the year concerning which Water Commissioner Grant testified, it being a year when the flow of the river was only about 50 per cent of normal, we find from Exhibit K, concerning the Lake Hattie reservoir, that storage from the Big Laramie commenced April 25 and ceased June 13. As to Lake James, that storage commenced April 19 and ceased May 25. Now in the year 1913, it appears that this storage occurred only during the flood season; but no such statement can be made concerning the year 1912. Wheatland Reservoir No. 2 is a channel reservoir; there would, therefore, be no record as to when storage commenced or as to its continuance, and we are given no information concerning the time of storage in either year as to Wheatland Reservoir No. 1. However, Exhibit K states that on April 29, 1913, Wheatland Reservoir No. 2 contained 76,000 acre feet of water. It will be remembered that Meeker, who made the table shown on Exhibit K, contended that Wheatland No. 2 reservoir held only 83,400 acre feet. Apparently the reservoir was filled to a point approaching capacity very early in season of 1913.

Mr. Field, State Engineer of Colorado, reviewed or analyzed at length the various tables and measurements produced by the witnesses for the plaintiff, particularly those of Meeker, concerning or relating to the storage in these four reservoirs (3482, 3489) from which it appears that in the year 1912 there was stored in these four reservoirs *in addition*

to the amount withdrawn for use and in addition to the loss by seepage and evaporation, the total of 156,000 acre feet, divided as follows: Lake James, 18,400 acre feet; Wheatland No. 2, 47,000 acre feet; Wheatland No. 1, 10,500 acre feet; Lake Hattie, 80,700 acre feet. May we emphasize that this represents the amount of water stored in excess of the use, waste and the loss (3488). It is furthermore remarkable to read the testimony of two witnesses, W. L. Ayres and W. A. Baker, farmers on the Wheatland tract, referred to in the plaintiff's supplemental brief at pages 78 and 79, that they were short of water, Ayres testifying: "There have only been one or two years that the farmers had all the water they wanted," and to compare this with the testimony of the superintendent of the Wheatland system, Mr. Elliott, to the effect that in the normal year of 1912, after 100,000 acre feet had been used on that area, 40,000 acre feet of water was left in Reservoir No. 2 at the close of the irrigation season (107). M. R. Johnston testifies to the history of the Wheatland reservoir, describing the threatened destruction of the reservoir at least upon one occasion, through inability to discharge the water from the reservoir as rapidly as it entered, and showing that as a rule water was carried over from one irrigation season to another, although occasionally in dry years the water was all withdrawn (51 to 60).

When we further remember the fact that the Wyoming appropriators annually needlessly waste enormous quantities of water and deliberately run great quantities of water into sunken areas, the only escape from which is evaporation, even during the winter months, it would seem that any claims of shortage are ill-founded (94, 858, 1280-4, 1288, 2733-50, 3562-75).

IV. DUTY OF WATER.

Counsel for plaintiff in their supplemental brief, after discussing what they term the theoretical duty of water, which they contend leads into a maze of opinions, assumptions and surmises, state that they believe "there is a more satisfactory method of determining the adequacy of the water supply of this stream, viz: by showing that in fact the entire flow had been used without waste. This method requires no consideration of stream flow records leading necessarily to an unsatisfactory conclusion, nor any determination of the exact acreage of land irrigated, nor any conclusion as to the theoretical duty of water." Had the testimony shown that the full flow of the stream had been appropriated *without waste* and that there had not been a sufficient amount of water for the irrigation of the Wyoming lands, it might have been of little value to have gone into these so-called theoretical discussions of stream flow and duty of water. However, such is not the case. Enormous quantities are wasted (1280-4, 1288, 2733-50, 3562-76). Lake Hattie, the surveys of which were commenced in the year 1908, that being its date of priority, stored water during the irrigating season of 1912, from both the Big and Little Laramie rivers. Lake James, also dating from 1908, stored water during the whole season of 1912 from the Little Laramie River. That year the managers of the Wheatland system distributed 100,000 acre feet and carried over 40,000 acre feet in their Reservoir No. 2 at the close of the season. As a matter of fact, they did worse than this, for Elliott, the superintendent of the system, testifies that the amount stored in Reservoir No. 2 alone, from the close of irrigation in 1911 to the close of irrigation in 1912, was about 140,000 acre feet (170). They had additional storage in Reser-

voir No. 1, and some suplpy from Sybille and Blue Grass creeks. Adopting the language of the former superintendent, M. R. Johnston, it was their habit to divert all the water from the Laramie River unless the appropriators below "hollered too loud."

Manifestly all the water of the stream was not appropriated to beneficial use, therefore the so-called theoretical duty of water becomes of intense interest. As we said in our original brief, we cannot attempt an exact definition of the term, "duty of water," except that it defines the amount of land which a given quantity of water should reasonably irrigate, and the higher the duty, the less amount of water needed for the unit of area. The term is frequently used to specify the amount of water which is used, rather than the amount which is needed. From the statutes of the State of Wyoming, it is apparent that the law making body of that State intended to place a limit upon the amount which might be diverted from the stream, and for that purpose the maximum quantity which might be diverted was fixed, this being designed to supply the needs of lands under the most adverse conditions within the State. This statute provides that no allotment for irrigation shall exceed one cubic foot per second for each 70 acres of land irrigated. Revised Statutes of Wyoming, § 872. This statute of course specifies a maximum of flow rather than a definite quantity, but taking into consideration the irrigation season, the maximum quantity permitted under this statute may be determined. Considering the Wheatland tract, M. R. Johnston, formerly superintendent, stated that the irrigation season was from 90 to 100 days (91). The demand was not constant, but fluctuates during the season, as the water is required for different crops, there being at times short periods when no water is

needed at all by the individual farmer, the average farmer drawing water from 80 to 85 per cent of the time during the irrigation season (201, 203), the greatest demand being during the latter part of June (208), the quantity required diminishing until the 15th of August, after which time two "runs" are made (209). It therefore is obvious that the Wheatland tract does not require the maximum amount of water permitted by the law of Wyoming for the full period of the irrigation season. However, let us consider this question of the amount of water applied to these lands upon the assumption that there is a legitimate demand for one cubic foot of water for each 70 acres of land within the tract without diminution during a 90 day period. This would amount to approximately 180 acre feet of water for each 70 acres of land. The Wyoming witness, Mr. Elliott, first testified to 33,000 acres in round numbers under irrigation in the Wheatland and Bordeaux tracts. On this basis the total amount of water for this 33,000 acres of land, which might be legitimately distributed if conditions imperatively demanded it, would be, in round numbers, 85,000 acre feet, and yet, in the face of the contention that there was a shortage of water testified to by a few individual farmers produced as witnesses for the plaintiff (but see *contra* 205), the evidence discloses that there was distributed to the Wheatland tract 100,000 acre fee that year, or 15,000 acre feet more than the law of Wyoming permitted under the most adverse conditions—conditions demanding the highest amount of water—conditions which it cannot and will not be contended prevail in the Wheatland area. As a matter of fact, if the demand for water exists for only 80 to 85 per cent of the time covered by the irrigation season, and even then the demand is for quantities varying according to the needs of the crops, it is

readily seen that the Wheatland area in the year 1912 must have received an amount very much larger than 15,000 acre feet above the amount which could legitimately have been applied. However, for the sake of the argument, conceding them the mamimum amount and contending for only 15,000 acre feet in excess of what they might have used, we find that they carried over in the reservoir at the close of the irrigation season of 1912, 40,000 acre feet of water, these two items making a total of 55,000 acre feet, substantially the same amount that it is sought to divert through the Greeley-Poudre tunnel.

As a matter of fact, there are only 28,623.75 acres irrigated in the Wheatland tracts, instead of 33,000, which we have assumed (195). Our illustration, therefore, is more than generous to the plaintiff. And Mr. Elliott testified: "I have ordered several farmers there to quit wasting water" (205).

In considering the flow of the streams, Mr. Meeker, the Wyoming hydrographer, attempted to show a distribution of the water from the Big and Little Laramies (see Exhibits T-7, T-8, at pages 1260, 1261). Considering first the Little Laramie, according to the table Exhibit T-8, there was distributed to "ditches between No. 2 dam and Two Rivers 17,245 acre feet" in the year 1912. No. 2 dam on the Little Laramie is the diversion point for water from that stream to Lake Hattie. Two Rivers is the junction of the Big and Little Laramie rivers. According to the survey made by the defendants, there are 31,341 acres irrigated between these two points. According to Wyoming, the area is larger. Now if Meeker be correct in his statements concerning stream flow, and also that only 17,245 acre feet were used in the year 1912 for the irrigation of this area of land, of which the least amount testified to was 31,341 acres,

he shows distribution amounting to only .55 acre feet per acre for the irrigation, by flooding, of an area devoted almost entirely to native hay meadows. This is so palpably an error that it scarcely needs discussion. The evaporation alone would probably not be accounted for by the .55 acre feet. It must be remembered that these meadows were irrigated, as described by the witness Grant and others, not by the use of distributing laterals, but largely by the construction of dams in such a manner as to cause "copious flooding."

Passing for a moment to the consideration of the Big Laramie, in Exhibit T-7, Meeker states that there was distributed to the Pioneer Canal in 1912, 17,703 acre feet. He also testified that there was under this canal 11,556 acres. Our survey determined 10,605. Therefore, if his stream flow measurements be correct and his distribution also correct, we find that there was applied to the lands under the Pioneer canal, which are also largely native hay meadows where the method of irrigation is substantially the same as on the Little Laramie, 1.6 acre feet per acre.

This discrepancy is remarkable. Obviously he is in error somewhere, and the contention of plaintiff throughout this whole case has been that water was applied to these hay meadows to an unnecessary amount. But Mr. Meeker found only so much water flowing in the stream. According to his measurements, the big channel reservoir lower down, Wheatland Reservoir No. 2, intercepted all the flow at that point. It had been more than filled in the year 1912, and Meeker must of necessity, when he attempted to show the distribution of this water, keep the amount distributed down to the amount which his stream measurements disclose, or otherwise all his measure-

ments would be worthless. Therefore, not only does he contend that Wheatland Reservoir No. 2 has a capacity of only 83,400 acre feet, as against the amount of 126,000 disclosed by the survey thereof, but he reduces the amount which he states is distributed to these lands under irrigation on the Little Laramie River to a quantity which is ridiculously low. It is only, therefore, natural that there should be a lack of consistency when his figures are analyzed. If the duty of water on the Little Laramie is only about .55 of an acre foot per acre, why, under exactly similar conditions, should it be 1.6 on the Big Laramie, and why should the Wheatland people, as Elliott testifies, receive from 2.6 to 2.7 acre feet per acre? Let us cite Meeker's conclusions concerning the duty of water, even in the face of his previous figures. He testifies: "From my records and experience, the duty of water diverted from the Laramie River between the Pioneer dam and Two Rivers stations is approximately one acre foot per acre. This includes copious flooding of the meadow lands and irrigation of the pasture land adjacent to the river, If all the lands irrigated between these stations were included, the duty of water would be higher" (4317). A higher duty means less water. Concerning the lands on the Little Laramie, he also placed the duty of water at one acre foot per acre. This particular testimony was by error, omitted from the abstract. We therefore take the liberty of quoting from the original transcript (4320):

> "Q. I neglected to ask you if you could state approximately the duty of water realized between Lake Hattie No. 2 dam on the Little Laramie and Two Rivers? A. That is also approximately one acre foot per acre per annum.

Q. Is the general character of the irrigated crops grown there similar to that in the Big Laramie valley? A. Yes, sir.

Q. Including meadow lands and irrigated pasture? A. Yes, sir, and on account of the copious application and large return waters, there is also a large re-use of water between the two points, which accounts for the high duty.

Q. What can you say of the relative rapidity of the return flow in that portion of the stream? A. That is also very rapid."

Here again we find that his conclusions are at material variance with the statements contained in his table. But accepting his conclusion that the duty of water on the Laramie Plains is one acre foot per acre, and also accepting his conclusions which are adopted by the plaintiff in its supplemental brief on page 115, that the average annual flow of the Laramie River is not to exceed 200,000 acre feet, and the average annual flow of the Little Laramie 100,000 acre feet, and also accepting, for the sake of argument alone, the further statement that these two sources constitute the entire supply of water available for the irrigation of the Wyoming land claimed to be irrigated, we find that there is a total of 310,000 acre feet of water, with a duty of water of one acre foot per acre, or a sufficient amount on this basis to irrigate 310,000 acres of land. And yet Wyoming contends for a total of 152,097 acres irrigated, including all of the irrigated lands on the Laramie River supplied with water not only from the Big and Little Laramies, but also from the tributary streams, and including also the total amount under irrigation in the Wheatland tract.

When the evidence is analyzed, where is there anything upon which Wyoming can stand, assuming that her own testimony concerning the supply is correct, and also that her claims concerning the amount of land irrigated are correct?

Under this state of facts the defendants are most certainly entitled to a dismissal, because Wyoming, the plaintiff in this case, has failed to show any damage whatsoever or any threatened damage, because of the diversions now made and those proposed to be made by the State of Colorado and its citizens.

Referring briefly to the conclusions of Mr. Field concerning the flow of the streams, to the effect that the normal flow of the Big Laramie at the state line is in excess of 250,000 acre feet and that the total amount of flow in the river available for the irrigation of all lands down to and including the Wheatland tracts was 431,200 acre feet, and applying Meeker's duty of water, there is enough for 431,200 acres of land, from which, if we deduct the 56,000 acre feet per annum proposed to be diverted by the Greeley-Poudre tunnel, or even deducting the total amount in contemplation through this system, 71,000 acre feet, there remains a sufficient amount of water for the irrigation of 360,200 acres of land. If we apply Professor Carpenter's conclusions as to stream flow, then this amount is increased even more and after the deduction of the amount proposed to be taken by Colorado, there would remain, for Wyoming, water for the irrigation of more than 400,000 acres.

Let us revert again to Meeker's conclusions. His testimony concerning the duty of water was as to the Laramie Plains only. Now if it be contended that the duty of water is lower on the Wheatland tract, let us deduct for the irrigation of that tract the

amount which ich they might possibly contend is legiti-
mate, it being ing the maximum amount permitted by
the laws of W f Wyoming, that is, 85,000 acre feet. We
then have, ac according to Meeker's figures, water
enough in the the Big and Little Laramie rivers alone
for the irrigat igation of 225,000 acres of land under a
duty of water ater of one acre foot per acre.

In acceptin epting the plaintiff's testimony of stream
flow, etc., we d we do so solely for the sake of argument,
contending tha that our evidence in this regard is of
higher value th ue than that of plaintiff, but we submit
that even und under plaintiff's own testimony, it has
failed to sustai sustain the burden of proof. On the con-
trary, it has sh as shown that no damage whatsoever can
result to it by r t by reason of the diversions of which com-
plaint is made. ade.

In view of ew of the condition disclosed by this wit-
ness, is it at all at all surprising that the State Engineer of
Wyoming has is has issued permits for the construction of
the systems desi ns designed to divert a vast amount of addi-
tional water fro ter from the Laramie River and its tribu-
taries in Wyomi Wyoming? (See table, p. 228, Vol. II, defts.
orig. brief.) Ap f.) Apparently he was justified in so doing,
although counse counsel for the plaintiff, in their supple-
mental brief, de rief, devote a chapter commencing on page
221, to an attem n attempt to explain these permits or pos-
sibly to excuse th xcuse the action of the State Engineer. (But
see *contra*, pp. 1 *a*, pp. 191 to 231, incl., Vol. II, defts. orig.
brief.)

Plaintiff lays
Colorado's whole ntiff lays great stress upon a contention that
compel prior Wy 's whole defense depends upon her right to
reservoirs. We rior Wyoming appropriators to construct
right to complain rs. We do contend that Wyoming has no
water within the complain of the beneficial application of
ithin the State of Colorado so long as she

has an abundant supply for her own use either from the direct flow of the stream or from that and water stored in reservoirs. If necessary, although it is not at all clear that such is the case, Wyoming, we contend, should, so far as is practical, conserve her flood and winter waters and cease her enormous needless waste before making complaint of a beneficial application in Colorado.

V. CONTRAST IN AREAS.

It is claimed by plaintiff, however, that the value of the product from irrigation in California, for illustration, justifies expenditures for the conservation and distribution of water, which would clearly not be justified by the value of the hay raised upon the ranches upon the Laramie Plains.

This introduces the further contention of the defendants, that even though there should be a question as to the adequacy of water supply, that the doubt must be resolved in favor of the State of Colorado, if for no other reason than that the returns obtained from the application of water in the Poudre valley amounts in value to from five to ten times what it will be if this water were applied upon the Laramie Plains. To this end, we went to exhaustive lengths to show the character of the development now reached upon lands under irrigation in the Laramie Plains and in the Poudre valley and the results based upon experience in each area to be expected from the application of the water from the Laramie River to the lands of the Greeley-Poudre district, in contrast to the returns to be expected from lands under irrigation upon the Laramie Plains. May we most urgently request a consideration of this discussion under the head of "Comparison of Areas," commencing on page 99, volume 1 of our original

brief. We produced this evidence and numerous exhibits were introduced, in order to give to the Court a clear idea of the contrast between these two areas. (See *Bailey*, 2575-2612; Heidke, 1727, 1780-2; Edwards, 2190-2204, 2232-2236; Timothy, 2341-72; *House*, 2388-2453; Gardner, 2916-30; *Carpenter*, 2931-91; Field, 3046-76; Parker, 3095-3112; Ewing, 3113-27; Mattox, 3172-77; *McCreery*, 3178-98; *Rothchild*, 3198-3219; Drake, 3220-37; McClelland, 3238-51; Baxter, 3252-66; Watrous, 3268-74; Gillette, 3278-98; Hottel, 3298-3304; *Petrikin*, 3305-33; 3580-87; Link, 3375-86; and Officer, 3511-26.)

To review this evidence would be merely to make a restatement of our former brief in this regard. Suffice it to say that every phase of agricultural development in the areas under consideration was considered in the testimony. Comparisons of census reports for many decades were tabulated or diagramed in order to show the rapid development in the Poudre valley and the relative absence of development on the Laramie Plains (House, 2388-2453). Meteorological reports were resorted to, statistics of all kinds relating to agricultural products were introduced; photographs of development on the Laramie Plains showing the character of improvements (Deft's. Ex. 115 and 116—albums), were introduced in contrast with similar photographs taken in the Poudre valley (Gardner, 2916-30, Deft's. Ex. 119, 120 and 121), and the testimony of many experts given, of whom probably the most notable is Dr. L. H. Bailey of Ithaca, New York, whose testimony will be found in the transcript at pages 2575 to 2615, inclusive. Dr. Bailey's testimony was procured because of his eminent standing as an agriculturist and his lack of interest in the outcome of this case. He testified that the two areas were to be contrasted,

rather than co[illegible]red (2584), and in substance that the Poudre va[illegible] is an area of remarkable agricultural developm[illegible] capable of supporting many times the populatio[illegible]ich can be supported by the Laramie Plains, [illegible] is primarily a livestock producing area and [illegible]h, because of the severity of the climate prese[illegible] very interesting experiment in agriculture; b[illegible]at its possibilities are limited to the growth of [illegible] hardier crops and that it will develop further[illegible] as a grazing and to some extent as a fe[illegible] region with such accompanying forage as can[illegible]rown with profit. Concluding, he says as follo[illegible]

> "To[illegible]y sum up the principal reasons why[illegible]Poudre valley area is, in my judgmen[illegible]uch superior to the Laramie Plains a[illegible] an agricultural region, I think I [illegible]do more than practically repeat the[illegible]ent I have already made in my testi[illegible] I feel that the development that is [illegible]neral Greeley District is one that is i[illegible]to produce more value per acre an[illegible]r diversity in cropping, to maintai[illegible]ger rural population and more r[illegible]tural. Tustries founded on agriculthese [illegible]ral fundamental reasons for cated, [illegible]s, as I have already indiparticu[illegible]hiefly are soil and climate, is difficu[illegible]latter, for the reason that it sible to[illegible]rcome climate, but it is posconditio[illegible]e some difficulties in soil the cli[illegible]nther words, I should regard ing fa[illegible]a more important controlequal, i[illegible] soil, other th[illegible]gs being in it a[illegible]tis such that crops can grow

The testimony of this witness is very significant in view of the constant contention made by the defendants that the Laramie Plains area, although earlier in settlement than the Poudre valley, was still undeveloped except as a stock-raising country, and that the irrigation upon that area was devoted almost entirely to the production of native hay; whereas, on the other hand, the Poudre valley is an area producing crops of very high value, such as sugar beets, potatoes, fruit, vegetables of all sorts, alfalfa and small grains.

We have previously referred to two tables showing the classification of irrigated lands covered by the surveys made by the defendants of the Laramie Plains areas, exhibit 117 pertaining to the lands on the Little Laramie and 118 on the Big Laramie in Wyoming. The classification of these areas, together with the number of acres devoted to the various purposes according to these two exhibits, may be summarized as follows:

Meadow (native hay)	39,732.9 acres
Pasture (irrigated)	12,737.8 acres
Alfalfa	1,659.0 acres
Oats	2,150.6 acres
Other grains	268.9 acres
Potatoes	37.4 acres
Garden	19.6 acres
Flax	19.0 acres
Plowed ground	3,095.1 acres

The testimony of witness E. B. House, professor of civil and irrigation engineering at the State Agricultural College of Colorado, is also very interesting, inasmuch as it is directed to a review of the census reports for the decades from 1870 to 1910, inclusive, and also to a consideration of the meteorological re-

ports showing the temperatures at Greeley, Colorado, and Laramie City, Wyoming, for two decades, 1893 to 1902, inclusive, and 1903 to 1912, inclusive. Comparison of the areas as to population, production, etc., based upon census reports, is shown by charts, Exhibits 86 to 104, inclusive. The meteorological reports are summarized on the diagram Exhibit 105, from which it appears that the average number of days in the season above frost, based upon the records of twenty years, is 125.5 days at Greeley and 57.6 at Laramie. The testimony of Professor House appears at pages 2388 to 2453, inclusive.

It is almost impossible to attempt to review all of the evidence introduced to show the high state of development in the Poudre valley, particularly the potato industry (3095-3112, 3178-98, 3198-3219); the production of sugar from sugar beets and the feeding of livestock (Petrikin, 3305-33, 3580-87; Timothy, 2341-72; Drake, 3220-37, and McCreery, 3189-94); production from market gardens and orchards (3185-88; 3172-77; 3238-51; 3252-66; 3238-51); the material improvements, such as railroads, public buildings and institutions, towns and cities, and all of the other things which prove a highly posperous district.

Aside from the verbal testimony introduced for this purpose, photographs were taken, to a portion of which we wish especially to draw attention: Exhibits 119 and 120 are albums containing photographs of the improvements under the Larimer County Canal and under the Larimer and Weld Canal in the Poudre valley. The development under these canals is typical of the area. Moreover, the Larimer and Weld Canal dates from the year 1879, the same year in which the Pioneer canal on the Laramie Plains was constructed. The Larimer County Canal is two years

later. Contrast these with the development shown by the photographs in Exhibit 116, which is an album containing pictures of the farm and ranch improvements on the Laramie Plains in Wyoming, and note also the contrast shown by some large panoramic photographs of the Wheatland and Laramie Plains areas upon one hand and of the Poudre valley on the other, shown in Exhibit 122.

As will be seen from a glance at the map, Exhibit 1 attached to the answer of The Greeley-Poudre Irrigation District, the lands within that district lie immediately adjacent to those now under development in the Poudre valley, and it is to be expected that with irrigation, the same development will result when the lands of this district are reclaimed. The evidence proved that, without any exaggeration, the returns from the use of water in the Poudre valley were actually from five to ten times the returns from lands under irrigation on the Laramie Plains (1782, 2967). The reason for this difference is obvious (2938, 2965). The average elevation of the Poudre valley is between 4,500 and 5,000 feet above sea level. The average elevation of the Laramie Plains is about 7,100 feet. Doctor Bailey testified that for the sake of comparison elevation can be projected into latitude. That if this be done, the Laramie Plains area might be compared to a point in the general latitude of Edmonton, Alberta, except that the Laramie Plains lacks the greater length of day which prevails in the northern latitude (2598; see also 2965). Eliminating a discussion of properties of soil in the two areas (2596-7, 2937-8), it is obvious that the lack of development in the Laramie Plains along lines of agriculture is due to adverse climatic conditions which cannot be overcome, and that its development along these lines is limited, so much so

that their development commencing at a date earlier than the settlement of the Poudre valley (2598-2601, 2937-44), shows today an area devoted almost entirely to the production of live stock and agriculture connected therewith, that is, the production of native hay. It is remarkable that of the 31,341 acres classified in Exhibit 117, 22,081 acres are devoted to meadow land producing native hay, 5,801 acres irrigated pasture and only 219 acres to alfalfa, 1,319 acres to oats, and a mere nominal amount to other crops; and of the lands classified in Exhibit 118 a total of 29,279.3, 17,651.9 acres are meadow or native hay lands, 6,936.8 acres irrigated pasture, and only 1,440 acres were devoted to alfalfa, 831.8 acres to oats and a mere nominal amount to other crops.

The Wheatland area, lying at an average elevation of about 4,700 feet, should become more of a normal agricultural district. The development already made there is an indication of what may be expected and we make no contention that this area is other than normal for irrigated lands of similar altitude and latitude.

VI. THE PRIORITIES OF APPROPRIATION.

In view of the language in the second paragraph of the order restoring this case to the docket, it becomes necessary to consider the relative priorities on the Laramie River in Wyoming and in Colorado.

Volume II, pp. 132 to 256, inclusive, of the original brief filed by defendants, contains an exhaustive discussion of the facts and evidence concerning the relative priorities of the Greeley-Poudre enterprise here in question and the subsequnt large and junior enterprises for which permits have been granted in Wyoming, a part of which have been completed to a greater or less degree, notably The Laramie Water

Company's system (Lake Hattie, etc.); the James Lake system; enlargement of the Wheatland system; the enlargement to King ditch; Sodergreen Highline and others of minor importance, and we respectfully refer to that portion of our original brief to avoid repetition of the discussion there appearing.

The decree of the District Court of Colorado adjudicating the priority of the Greeley-Poudre enterprise, including its several units, was offered in evidence as defendant's Exhibit No. 179 (3933). The table appearing in this decree also contains reference to certain other small ditches along the Laramie valley which were adjudicated in that decree. This, however, was a decree obtained upon a supplemental adjudication. The decrees of the District Court of Colorado for the former adjudications fixing the priorities of canals and reservoirs earlier in date than those appearing in Exhibit 179 were not offered in evidence by either party.

(1) The Colorado Diversions.

We have previously shown that a survey of the lands within the Laramie River valley in Colorado under irrigation amounts to a total of only 4,250 acres (3459). These lands consist of narrow strips of native hay meadow along the river or its tributaries irrigated by means of a number of small ditches, the diversions taking the water a short distance from the stream. The land irrigated, according to the Wyoming engineer, Whiting, who made a survey of the course of a few of these ditches (p. 1265 of record—not in abstract), generally extended from 500 to 600 feet from the stream, some of the ditches reaching a distance of approximately 1,200 feet away from the stream (1266, 1275). See also the plat of this irrigated area made by the engineer Wortham on behalf

of the defendants, Exhibit 130, and the testimony of Wortham (3454-3462). No complaint is made against the diversion by these ditches, neither is complaint made of the diversions by means of the Skyline canal, nor the Divide or Wilson Supply canal. We shall therefore first consider briefly the priorities of these appropriations.

Fourteen out of the many ditches used for the irrigation of these 4,250 acres of land in the Laramie River valley in Colorado and the dates of construction thereof are given at abstract pages 3334 to 3336 and may be summarized as follows:

Name of Ditch.	Date of Construction.
Long Park No. 1	1902
Link Ditch No. 1	1894
Link Ditch No. 2	1896
Hills Ditch	about 1880
Yelton Ditch	1880 or 1882
Upper Smith-Brown Ditch	1879
Lower Smith-Brown Ditch	1880 or 1881
Comet Ditch	1895
Homestead Ditch	about 1884
Mansfield Ditch No. 1	about 1882
Mansfield Ditch No. 2	about 1878 or 1880
Bliler & Boswell Ditch	prior to 1880
Warren Ditch	about 1880
Stuck Creek Ditch	1881

These are a sample of the meadow ditches in the narrow Colorado valley. The land irrigated by means of these ditches is devoted to the production of native hay. The water is applied plentifully and because of the proximity of the lands to the stream and the heavy slope, there is a constant return flow from the lands irrigated back into the stream. The irrigation season commences from the first to the

15th of May and continues until about the middle of July (3336, 3342). Exactly the same conditions prevail on the upper reaches of the Little Laramie valley in Wyoming, that being the area on the stream above Filmore, the station at which measurements were taken (1110, 3314). As we have previously stated, neither of the parties to this cause attempted to make any charge for the amount of water diverted from either stream for the irrigation of these mountain meadows. The more recent of these appropriations in Colorado as adjudicated by the District Court of the State of Colorado in and for the County of Larimer are set forth in the decree, defts. Ex. 179 (3393). We do not contend that this decree is any more binding upon the plaintiff in this case than are the decrees of their Court on us, but we wish the Court to understand the status of these and other ditches and that the appropriations made by means of them have been judicially determined by the courts of the State of Colorado.

We next desire to consider the Skyline canal and the Divide or Wilson Supply ditch, these being the two ditches through which for a number of years diversions had been made from the Laramie River for use in the Poudre valley, and which the defendants admit will divert about 20,000 acre feet per annum on the average. This we have previously explained. These two ditches are not specifically complained of in this proceeding. The construction of the Skyline canal was commenced in the year 1891 and completed in 1893 (2206). It has a carrying capacity at its lower end of 130 cubic feet per second (2209). This appropriation has also been adjudicated in Colorado.

The date of construction of the Divide or Wilson Supply canal does not seem to have been definitely fixed in the record. However, according to the table,

Exhibit 124, this ditch is credited with water in the Poudre in the year 1902 and subsequent years. It is obvious, therefore, that the work of construction was completed prior to that year.

The decree of the District Court in and for Larimer County, in which these priorities were adjudicated, was not introduced in evidence. However, a later decree including the diversions made by the Greeley-Poudre system (Exhibit 179), shows that this decree, so offered in evidence, commenced with priority No. 65; that priorities numbered 1 to 64 have been covered by the previous decrees on the Laramie River, the appropriations being made in part by the ditches hereinbefore mentioned. It must not be understood, however, that this means there were 65 ditches. A number of the ditches had several decrees, arising by reason of enlargements after original construction. Each enlargement is a new and separate appropriation and takes its junior priority.

The evidence upon which the foregoing discussion is based defines the limits of the beneficial use to which the Laramie River had been put in Colorado prior to the inception of the Greeley-Poudre system, and may be summarized as follows: Through a number of ditches diverting water from the Laramie River there was irrigated in Colorado 4,250 acres of land, all of which lie immediately adjacent to the steam or the tributaries from which the appropriations were made, and was devoted to the production of native hay. From these lands there was a very rapid return to the stream. The amount thus used has not been taken into consideration in any stream measurement. And, secondly, there was actually diverted from the Laramie River watershed by means of the Skyline canal, constructed in 1891, an amount

which will average 16,000 acre feet per annum, and through the Divide or Wilson Supply Canal, constructed prior to 1902, an amount which will average 4,000 acre feet per annum.

(2) The Wyoming Diversions.

As we have previously stated, no evidence was introduced from which a clear line of demarcation can be drawn between the development prior to August 25, 1902, and after that date; nor during a period prior to May 29, 1911, or after that date. These two dates are the dates of the commencement of the Colorado construction complained of and the date of the inception of this suit, respectively. We did, as we have stated, attempt to determine the total amount of land under irrigation in Wyoming, but we are unable at this time to make a definite statement as to the amount of land which was reclaimed by irrigation from the older ditches, or the amount reclaimed by irrigation by the newer projects, except as the same is reviewed in the supplemental brief of the plaintiff wherein, under the heading "The Contested Priorities," the newer projects in Wyoming are discussed.

Omitting a few small ditches, the newer projects in Wyoming now constructed or substantially constructed, include the Bordeaux and Sybille units of the Wheatland tracts; the Lake Hattie system; the Lake James system; the Hutton Lakes system; and the Sodergreen Highline. In addition to these there are many others of immense size for which premits have been issued, but on which no material work of construction had been done at the time the evidence was taken. (See table, Vol. II, p. 228, defts. orig. brief.) We will discuss these projects in the order in which they are mentioned.

(a) *Wheatland Project.*

The original Wheatland tract, consisting of 60,000 acres, is reclaimed to the extent of 29,000 acres. This project dates from the year 1884. It appears from the testimony that at a time when only a very small percentage of the lands of the tract were under irrigation, storage facilities were provided by the Wyoming Development Company, the projectors of this system, who began the construction of Reservoir No. 1 and Reservoir No. 2. Reservoir No. 1 having a capacity of 7,000 acre feet, and Reservoir No. 2 a capacity of 126,000 acre feet. In addition to this storage, they have the direct flow of the Laramie River, through their inter-mountain tunnel, and of the Sybille and Blue Grass creeks, for the irrigation of this tract. Reservoir No. 2 was completed about 1900. It is significant that according to the witness, M. R. Johnston, there was only about 10,000 acres of land under irrigation in the Wheatland tract in 1900, and yet they had a storage capacity in these reservoirs, in addition to the direct flow of the river, to the amount of 133,000 acre feet. It is not surprising, therefore, that an attempt was made to find additional land upon which to put the surplus water available. Accordingly the Sybille and Bordeaux tracts were projected. They are what is geneariy known as "Carey Act" lands. The Bordeaux tract consists of 10,000 acres and the Sybille tract 30,000 acres (168-169). The ditches for the irrigation of these new tracts were an extension of the main system designed for the irrigation of the original Wheatland tract and a new canal from Blue Grass Creek (40), although the surveys for the ditches leading to the Bordeaux tract were commenced in February of 1904, construction work began in June, 1907, and for the system leading to the Sybille tract, the

surveys commenced in August, 1907 and construction work began in July, 1910 (108). When the evidence was taken, there was under irirgation in the Bordeaux tract, according to the plaintiff, only 1,004 acres (168), but the defendants' survey disclosed only 451 acres (Exhibit 2). The ditch leading to the Sybille tract was not completed when testimony was taken in 1913, and no land was irrigated in that tract (169). It is quite obvious that these two new projects resulted from the fact that the owners of the original Wheatland system found themselves in the possession of more water available in their reservoirs than was needed on the original tract. The Sybille and Bordeaux projects were an after-thought arising because of this condition. They were not in contemplation by the Wyoming Development Company at the time of the construction of the big Wheatland Reservoir No. 2, and do not relate back to the date of that reservoir, and much less to any date prior to that time. The witness, M. R. Johnston, testified that the Bordeaux tract was conceived for development somewhere about 1908 or 1909 and the Sybille or Cooney Hill tract some two years later (41), and that these two tracts were not in contemplation when he took charge of the system as superintendent in 1888 nor when the Reservoir No. 2 was constructed in 1900 (42).

(b) *Lake Hattie System.*

The next project, the Lake Hattie system which the plaintiff in its supplemental brief describes as consisting of the Lake Hattie inlet ditch takes water from the Big Laramie and Little Laramie rivers and consists in part of the Stewart ditch (being the inlet taking water from the Little Laramie), the Lake Hattie reservoir and the outlet canal with its

two branches, the North and South Canals. During the taking of the testimony, reference was made from time to time to various disconnected and random surveys made for various lines of a ditch to take water from the Laramie River, one or two of which were in the general vicinity of the line of the Lake Hattie inlet and the outlet canal from Lake Hattie. No construction had followed any of these surveys and they were abandoned. One of these suggested ditches was referred to as a possible Pioneer Highline canal, and in the original brief of plaintiff herein, an attempt was made to fix the date of the priority of the Lake Hattie system back to the date of some one or other of these old surveys known as the Loback and Bellamy surveys, made in the year 1886. (See page 76 plaintiff's original brief.) This contention, however, was not tenable, the evidence disclosing that there was absolutely no relationship between the old random surveys and the very recent surveys upon which the Lake Hattie system was constructed. (See Vol. II, pp. 234-53, defendant's original brief.) However, in order that there might be no possible misunderstanding concerning this, the defendants took great pains to review the evidence relating to these old surveys and the Lake Hattie system. Among other things it was shown that the Lake Hattie system was based upon the surveys commencing April 16, 1908 (646, 774) and not earlier, and that construction was based entirely upon permits issued by the State Engineer of the State of Wyoming between April 21, 1908, and July 11, 1912. (See defendants' Exhibits 159 to 167, inclusive; also the evidence of Ralph I. Meeker to the effect that these were the permits upon which the system was constructed, 1070, 1071). While it is true that the Lake Hattie system (but not any Pio-

neer Highline canal) was practically completed at the time evidence was introduced, nevertheless, there can be no serious contention for a date earlier than April 21, 1908, and we believe the claim to have been waived by the plaintiff, inasmuch as in their supplemental brief they state in substance that some such diversion as this from the Big Laramie River was in contemplation as early as 1884, "so that if the taking of thought, the making of intermittent surveys, the search for capital and capitalists and other activities incident to promotions may be considered such diligent prosecution of the work of construction as would entitle the promoters to the benefit of the doctrine of relation, the Lake Hattie enterprise might be considered to date from 1884."

"In the view of the plaintiff, however, these historic particulars are only valuable to show the connection between the works of the Lake Hattie system, as finally realized, and the original Pioneer canal enterprise projected and constructed in 1879 and the following years, * * * For the present we are considering this new work only as originating in the beginning of construction in July, 1909, in competition for priority with the Tunnel Project on which construction was actually begun near the end of that year."

There would seem to be no doubt whatsoever, and we believe that it will not be seriously contended, that the earliest date to which the Lake Hattie system is entitled is the date of its initial survey, April 16, 1908, evidenced by the permit issued thereupon by the State Engineer on April 21, 1908 and not the date when actual construction began in 1909. May we earnestly ask a consideration of the discussion concerning the permits relating to this system and to other systems in our original brief (Vol. II, pp. 198, 255).

We are unable to state the amount of land which it was contemplated to reclaim by this system. If the evidence discloses this amount, we are unaware of it. On page 39 of the supplemental brief of plaintiff, it is said that about 700 acres of new land were irrigated from this system in 1913. We have previously discussed the evidence showing the enormous quantities of water which have been stored in this reservoir prior to 1913. We are informed that the first water was taken from the reservoir early in July, 1911. Plaintiff's Exhibit K purports to give the amount stored during 1912 and 1913. If there were only 700 acres of new land irrigated from this system, we are interested in knowing what became of the water which was withdrawn from the reservoir. These defendants contended throughout the trial of this case that this water was merely wasted and that vast quantities of it were permitted to run through one of the distributing canals into a large depression known as Big Basin and into other waste lakes, from all of which there was no outlet. This contention was confirmed in part by the testimony of the water commissioner, Grant, who testified concerning this reservoir:

> "I did not know that they were running water out of Lake Hattie and wasting it into Big Basin until about the first of September. The only time I knew of their running water down into Alkali Lake or Alkali Basin was when they tried out the canal once or twice. It only ran for a day or so at that time. I heard that at a later time when Mr. Goldsborough had some prospective land buyers out there, he ran water for seveal days and wasted it into Big Basin. I did not go to look it up. I think there was consider-

able water left in Lake Hattie when I resigned, about September 15." (1286)

Defendants' contention in this regard was denied by the plaintiff, except that it was admitted that in testing the canal, some water was run through it and into one of the waste basins. It is interesting to surmise what became of the balance. May we again state that the total capacity of the reservoir is 110,500 acre feet, of which 62,500 acre feet are available (786-787).

(c) Lake James System.

Lake James, as has been previously explained, has an available capacity of 41,100 acre feet. It is filled from the Little Laramie, Seven Mile and Four Mile creeks. This system was initiated by survey begun March 22, 1908 (638). Several permits were issued for the construction of this system, the earliest being March 27, 1908 (3962). This reservoir had stored water for several years prior to 1913, although the evidence fails to disclose that any land had been reclaimed under it. On page 40 of the supplemental brief of the plaintiff, where this system is discussed, it is said: "Some 1,500 acres had been irrigated under this system, of which 515 acres were in tillage in 1913." Again it is of interest to ask what became of the vast amount of water which had been stored in this reservoir? It was admitted that unused water in lakes on the Laramie Plains evaporated at the rate of five feet in depth per year.

(d) The Hutton Lakes System.

We have previously explained in this brief that the water of Sand Creek has been heretofore diverted from its channel and permitted to flow into Hut-

ton Lakes, a natural basin from which there was no outlet. As we understand it, Hutton Lakes consist of two lakes, Hutton Lake and Creighton Lake. The names are sometimes used interchangeably. It seems that it was recently proposed to utilize these lakes as reservoirs by a company known as The Northwestern Land & Iron Company, the plan being to enlarge and extend the old King ditch, diverting water from the Laramie River, to build a flume or syphon across the bed of Sand Creek, and thus to utilize these lakes. The date of the surveys is not definitely shown. The plaintiff throughout the case appeared to evince very slight interest in this project, and no evidence is given as to the amount of land which it was proposed to irrigate by means of this new system. However, applications were filed in the office of the state engineer on June 3, 1909, on which permits were issued Oct. 17, 1909 (3961). The ditch, however, had never been completed, in that the flume or syphon across Sand Creek remained to be constructed and additional work upon the reservoir was yet to be done (322). In discussing this project (p. 39 of the supplemental brief) the plaintiff does not contend that any of the land whatsoever has been reclaimed by means of the system.

(e) The Sodergreen Highline Ditch.

Before discussing this ditch we desire to reiterate a former statement. This ditch diverts water from the Laramie River above the Pioneer dam, where measurements of stream flow were made by Mr. Meeker, the Wyoming hydrographer, who made no allowance for the amount diverted by this canal or other ditches in the same locality, when his measurements of the stream flow were discussed. The survey was commenced in November, 1907, and con-

struction was completed during the year 1910 (418-445). The permit for construction was issued April 14, 1908 (3960). The owner of the ditch, Oscar Sodergreen, testified that from four to five thousand acres of land had been irrigated by means of it (418). Some doubt, however, is cast upon these figures by further testimony of this witness at page 446, wherein he describes the irrigation under this ditch and says: "I don't know how much has been irrigated; all that I could. These lands lie in a regular natural slope, and it irrigates by just turning the water out of the ditch at intervals. It was raw prairie land. The greatest part is hay land now."

(f) General Discussion Junior Wyoming Projects.

These six projects, that is, the Bordeaux tract, Sybille tract, Lake Hattie system, Lake James system, Hutton Lake system and the Sodergreen Highline, seem to have been singled out from a great number of projects covered by surveys and filings made subsequent to the year 1902, probably because they were either completed or a material amount of construction work had been done upon them, and they take a position as more or less definitely fixed, because of that construction work. However, it must be borne in mind that they are by no means all of the projects proposed to be constructed within the State of Wyoming subsequent to the year 1902. *In Volume II, Part II of our original brief,* the question of priorities and the evidence relating to all these projects and also to the Greeley-Poudre system was very carefully and exhaustively reviewed. We most earnestly ask the consideration of the court to that discussion. It would seem unnecessary to again review the whole subject as fully as we did in our original

brief, but we desire to say that the evidence concerning the filings in the office of the State Engineer of Wyoming, upon which permits had been issued for projects, in addition to these which we have described, will be found in the transcript at pages 3909 to 3933, inclusive, and in Exhibits 159 to 178, inclusive.

The filings in the office of the State Engineer and the permits issued thereon have been classified and tabulated in connection with the discussion of this subject in Volume II of our original brief, particular reference being made to pages 214, 215, 217, 218, 219, 220 and 228. Suffice it to say here that the evidence discloses that many large projects for the diversion of water from the Laramie River in Wyoming, in addition to those previously discussed, have been surveyed, findings of ample water have been made by the State Engineer of Wyoming, and permits have been issued for the construction thereof long since the year 1902. These had not been constructed when the evidence in this cause was taken, but there is no suggestion that they have been definitely abandoned, and so far as these defendants are aware, these projects are still in contemplation of the persons promoting them and stand as large junior and approved claims from the river.

The situation relative to these six projects above specified may be summarized as follows: The Sybille and Bordeaux tracts were not in contemplation of the owners of the Wheatland system when the Wheatland Reservoir No. 2 was constructed, nor for many years thereafter. These two projects were afterthoughts, wherein it is proposed to utilize the surplus water already provided primarily for the irrigation of the original Wheatland tract. There can be no claim that these projects are entitled to a

date earlier than the date upon which their permits were filed. The doctrine of relation cannot be applied to give them a date concurrent with the construction of Wheatland Reservoir No. 2 or any other part of that system. Even if we ignore the Wyoming law and date them as of initial survey, the appropriation of water for the irrrigation of the Bordeaux tract cannot take a date earlier than February, 1904, nor can the appropriation of the Sybille tract date earlier than August, 1907. In passing may we remark that it is contended that various delays in the construction of the works designed for the irrigation of the Greeley-Poudre district lands destroy the continuity which it is contended must exist between the inception and the completion of the project, and that because of the lapse of time since the initiation of this system shown by the surveys made August 25, 1902, it cannot be contended that due diligence has been exercised by the owners of the Greeley-Poudre system. The difficulties in the way of this construction and the cause for these delays, we will discuss later, but it is interesting here to know that while the initial surveys for the system designed to irrigate the Bordeaux tract were made in February of 1904, nevertheless in the year 1913, when the evidence was taken, a mere nominal amount of land out of the 10,000 acres included within this tract had been irrigated and, the only work required in making the canal was the construction of a large lateral ditch leading from the main Wheatland system. No reservoirs were necessary. This ditch was constructed in a territory adjacent to lands now under irrigation, easily accessible, and yet the beneficial application of water, which is the ultimate test of appropriation under all laws relating to irrigation, had not been made. The ditch leading from the main Wheatland

system to the Sybille tract was surveyed in August, 1907, the conditions were almost exactly the same as those surrounding the Bordeaux tract, and yet in 1913, we find that this ditch to the Sybille tract had not been completed, water had never been run through it and not one acre of land in the Sybille tract had been irrigated except some small portions of privately owned lands located within the confines of that tract which had been irrigated from other sources. The charge of the lack of diligence upon the part of the defendant in the construction of the Greeley-Poudre system hardly comes in good faith in view of this situation, particularly when the difficulty of construction and the immensity of the project for the irrigation of the Greeley-Poudre lands and the enormous expenditure of money in construction are considered.

Passing now to the Lake James project we find that it cannot be contended, and as a matter of fact it is not contended, that it is entitled to a priority date earlier than March 22, 1908. This system was apparently completed and water had been stored during at least three seasons, when the testimony was taken, and yet we find that the plaintiff admits that only 1,500 acres irrigated under this system in the year 1913.

The Lake Hattie system was based upon surveys commenced April 16, 1908. It had been completed and water had been stored for several years and yet under this system the plaintiffs themselves contend for only 700 acres of land reclaimed.

The Lake Hutton system surveys were filed June 3, 1909, and yet this system is not completed and no water run through the inlet from the Laramie River and not an acre of land reclaimed under this

project although all this time the waters of Sand Creek, naturally tributary to the Laramie River and available for the use of many ditches below the mouth of Sand Creek which is some distance above the city of Laramie, are diverted into these lakes and allowed to evaporate. How can this condition be possible if the contention of the plaintiff that the ditches on the Laramie Plains had been short of water for years, be true? The defendants have contended throughout this case that there was a superabundance of water and that Wyoming has wasted a large portion of her supply. Here is indisputable evidence of that fact. Very evidently the findings of the State Engineer of Wyoming, of ample water supply, were correct.

The Sodergreen Highline, which was constructed upon surveys commenced in November of 1907, is completed and has been used for the irrigation of land testified to between four and five thousand acres in extent. The capacity of this ditch is not known although it is obviously of considerable size.

These projects are long prior to the Greeley-Poudre system. If priority of diversion regardless of state lines were to be applied to a case such as this, then obviously each one of these recently initiated systems, as well as all others contemplated by the permits to which we have referred, must be denied water until the demands of the Greeley-Poudr system on the Laramie River have been fully satisfied. However, we do not believe that that principle is the law of this case. The fact, however, that the Wheatland Reservoir No. 2 has storage sufficient for the irrigation of 40,000 acres of land in addition to the amount of land which it was originally designed to irrigate; the fact that Lake James has stored water to the amount of 41,100 acre feet and

practically no lands are yet reclaimed under it and that Lake Hattie has stored water to a total capacity of 110,500 acre feet, 42,000 acre feet of which cannot be withdrawn from the reservoir as it is now constructed, and that only 700 acres of land have been reclaimed under it; the further fact that these two reservoirs with a total active capacity of 109,600 acre feet have water sufficient for the irrigation of 109,600 acres of land according to the statements and conclusions made by the Wyoming hydrographer, Ralph I. Meeker concerning the duty of water on the Laramie Plains; the still further fact that water from Sand Creek has been wasted year after year in Hutton Lakes without any attempt to apply it to beneficial use; and lastly, the fact that each year enormous quantities of water are deliberately and needlessly wasted; all conclusively prove the contention of the defendants that there is more than an abundance of water for the irrigation of the lands now irrigated in Wyoming after deduction has been made for the diversion through the tunnel by the Greeley-Poudre system, and further that a surplus remains for the reclamation of thousands of acres in Wyoming.

(3) The Greeley-Poudre Diversion.

The appropriation of the Greeley-Poudre system from the Colorado branch of the Laramie River by means of the tunnel and collection ditches dates from August 25, 1902 This is the decreed date of the priority in the State of Colorado. (Exhibit 179) As we have stated, this Colorado decree is no more binding upon the State of Wyoming than Wyoming decrees are upon Colorado, but we refer to it in order to show that it legally establishes the date under the laws of the State of Colorado and is binding upon

all Colorado appropriations from this stream. The plaintiff contends that there is a lack of continuity both in the plan or design and also in work as originally proposed and as undertaken by The Greeley-Poudre Irrigation District, and that the tunnel as a means of diverting water from the Laramie River was not in contemplation of the original promoters, neither was it originally designed to irrigate the specific lands now included within the limits of the present Greeley-Poudre district.

This contention is not established by the evidence and the District Court of Colorado found otherwise. In fact, the evidence discloses a complete chronological connection between the original ideas of Wallis A. Link, who discovered the possibility of making this diversion and which he later planned, and the system now in a great measure completed. The only changes made were in no wise fundamental and arose merely because of the improved methods of construction suggesting themselves as the work progressed. The plan was in all respects the same from the first—to build three collection canals and the tunnel. However, it must be borne in mind that the tunnel is not the fundamental feature in the consideration of this appropriation. The tunnel was merely a factor, the means to an end. The whole purpose and object of the contemplated diversion from the very inception was to procure water available in the Laramie River for the irrigation of lands in the Poudre Valley.

A great deal has been said in the supplemental brief of the survey of a canal which the plaintiff terms "The Detour Canal." This title is entirely of their own invention. No such name was ever applied by the defendants or their witnesses. The surveys for this canal were commenced in the fall

of 1908 and continued into the year 1909. The line of survey may be generally described as commencing in the valley of the Laramie River at a point near Glendevey, about nine miles below the tunnel, running thence in a northerly direction along the side of the mountain forming the eastern wall of the Laramie River Valley in Colorado, to or beyond the Wyoming-Colorado line; thence easterly into a stream which is tributary to the North Fork of the Poudre River. Inasmuch as the range of mountains to the east of the Laramie River is very much lower in the general location of the Colorado-Wyoming line than further south, it was thought by some that it might be possible to construct a ditch running around this higher portion of the range and thereby divert the water from the Laramie River without the enormous expense of constructing the tunnel. The tunnel surveys and filings based thereon, as we will presently show, had been made some four years earlier and construction was proceeding. But the plaintiff argues the tunnel was not a definite part of the project at the time this ditch survey was made. In this they are entirely in error. We shall presently trace the history of the development of the Greeley-Poudre system commencing with August 25, 1902 but, for the time, considering only the contentions of plaintiff concerning this so-called Detour Canal, let us state that during the progress of the surveys and construction work upon the Greeley-Poudre system, but before the actual drilling of the tunnel was commenced, a reconnaissance survey was made in order to determine an alleged possibility of avoiding the enormous expense of tunnel construction. This was in the years 1905 and 1906 (1759), and in connection with the idea of a ditch such as we have described, it was thought possible to construct a reservoir in

the channel of the Laramie River near Glendevey or about nine miles below the present tunnel (1760-1767). Had this plan been feasible, the mountain ditches and the collection ditches already designed and partly constructed, as well as the tunnel, could be eliminated and the water carried around through the mountains between the Laramie River and the North Fork of the Cache la Poudre River. The result of the survey disclosed that this canal was impracticable (1768), and of course, with the failure of the scheme for the canal, there failed also the plan for the reservoir which would avail nothing for the irrigation of lands in the Poudre Valley. The previous plans for the collection ditches and the tunnel were thereby confirmed as being the only available method by which the water could be diverted from the Laramie River. However, we find from the testimony of D. A. Camfield, who became interested in The Laramie Poudre Reservoirs and Irrigation Company in the fall of 1908, that there was a body of land lying north of and higher than the lands within the area of the present Greeley-Poudre district, which were desirable for reclamation (2170), but which could not be irrigated by means of the diversion canal from the Poudre River. Accordingly in 1908 another survey was made of this line for a proposed ditch out of the Laramie Valley. This survey of 1908 being much more in detail than the reconnaissance of 1905 and 1906, but the result of this last survey was the same as before. Charles R. Hedke, the construction engineer of The Laramie Poudre Reservoirs and Irrigation Company, testifies that this detailed survey and investigation confirmed the former conclusions that had been reached in 1905 and 1906. The survey disclosed that "it required a ditch about 100 miles in length, with obstacles of every possible nature, steep

hillsides, unsuitable material, broken and disintegrated rock, and conditions were such that under ordinary ditch construction, water turned in at the head of the canal would undoubtedly be lost before it reached the lower end unless the canal were lined. Many tunnels were necessary; also syphons and flumes, and the character of the country required special construction for almost the entire length of the canal. That means of diverting water was entirely abandoned after that time. It would have cost about $30,000 per mile and 100 miles of that canal would make the cost beyond considration" (1762).

It must be borne in mind that the tunnel surveys had been made prior to this time (in 1904) and construction upon the collection ditches was progressing and this was simply an effort, in the first place, to determine an alleged alternative route for the diversion without the great expense of constructing the tunnel and, in the second place, to obtain if possible, water for lands capable of irrigation lying higher than the diversion ditch from the Poudre River (1838). The witness, Hedke, after reviewing the various surveys that were made in order to secure the most advantageous means and locations for the diversions from the Laramie to the Poudre River, says: "My conclusion was and is that the Greeley-Poudre tunnel is the only means of diversion between the Laramie River and the Poudre. It represents the final economical development for the purpose of diverting water from the Laramie drainage to the Poudre drainage" (1766).

We have mentioned the survey of a reservoir at Glendevey in connection with the survey of this proposed ditch around the divide. This reservoir site was known as the Laramie Reservoir. Of it engineer Hedke testifies: "Surveys of the Laramie Reservior

were completed, but it was separate and apart from the system commonly called the Greeley-Poudre system. It was surveyed and mapped as a subsequent and junior enterprise. It was surveyed sometime in November, 1906. * * * Later, those in charge of construction of a system in Wyoming—The Interstate Reservoir Company—interfered with the development and construction of this reservoir. This was after our survey. * * * They made application to the national government for rights of way which interfered with our work. We considered it was a proposition that would not be necessary in contemplation with our system and abandoned it for the time and no further steps were taken to perfect that portion of the work. * * * It finally worked out that some rights of way were obtained by the Wyoming people from the government" (1767). In this connection it is of interest to note that this same Wyoming company, The Interstate Reservoir Company, made a number of filings and was granted several permits for other ditches and reservoirs within the State of Wyoming, none of which were ever completed, except that possibly a portion of them were later woven into the Lake Hattie system (see Exhibits 170 and 171). The indefinite plans of the various parties in interest leading up to the Lake Hattie system as fiinally constructed also include in some indefinite way, a reservoir site for which filings were made, located at or near the Colorado-Wyoming line. This is known as the Robertson-McConnell Reservoir, named after two men by that name, who, at some time or other in the history of the Lake Hattie system were interested in some of the filings relating to it. A permit for the construction of this Robertson-McConnell Reservoir at the state line, was granted by the State Engineer of Wyoming on Octo-

ber 15, 1909 (Exhibit 177). This survey disclosed plans for a reservoir with a capacity of 335,831 acre feet. It is impossible for us to clearly define the claims of various promoters who were at one time or another interested in the Lake James and Lake Hattie systems, but it is obvious that even after construction these two systems were still in the speculative stage. By that we mean that they had a vast amount of water available and were evidently seeking land upon which to make the application. The claims of The Interstate Reservoir Company for a reservoir in Colorado at Glendevey and the claims for the Robertson-McConnell Reservoir at the state line for which a permit was granted, merely go to show that in the minds of these people there was sufficient assurance of a vast amount of water available for storage even after the diversion by the Greeley-Poudre district and that these people were contemplating the construction of these reservoirs, knowing of the work then being done upon the Greeley-Poudre system.

We believe that any argument, based upon the fact that a survey was made for the canal which plaintiff's counsel terms the Detour Canal, to the effect that at the date of that survey, the tunnel was not definitely planned or contemplated, will avail nothing. We have already explained, the tunnel was only a means to an end, and then after it had been planned a survey had been made showing the enormous cost of such construction, all alternative routes were sought in order to avoid this expense if possible. This alternative route proved to be absolutely impracticable and the tunnel plan thereforeto adopted in 1902-1904, was confirmed as the only feasible course to pursue. As we will show later, there can be no question—as a matter of fact it is ad-

mitted—that the survey upon the tunnel itself had been made in the year 1904, before the so-called Detour Canal survey was made, and obviously, in view of the fact that the tunnel was constructed as planned in 1902-1904, it cannot be contended that there was any abandonment of the plan for the construction of the tunnel.

VII. HISTORY OF GREELEY-POUDRE SYSTEM.

The possibility of construction of the Greeley-Poudre tunnel enterprise was first revealed to Wallis A. Link in 1897 while he was hunting on the divide between the Laramie and Poudre rivers. This discovery is the source of some irony by plaintiff in its original brief, for the evident reasons set forth in the defendants' original brief replying thereto, and, as there observed, while this discovery by Mr. Link in 1897 ultimately led to the actual commencement upon the tunnel enterprise of the Greeley-Poudre system on August 25, 1902, by Link and his associates, no claim of priority of appropriation for the enterprise has been asserted upon pretext of the date of discovery of the site in 1897, and it is also true, that no evidence was offered of previous discovery, observations or surveys by persons in no manner identified with the enterprise finally initiated. The discovery and all of the subsequent reconnaissance work by Link and his associate between 1897 and 1902 are but historical facts preliminary to the actual beginning of construction. (Vol. II, pp. 167-71, Defts. Orig. Brief.)

Following the discovery of the tunnel site, Mr. Link made further investigations of the feasibility of a general tunnel enterprise and thereafter interested A. I. Akin in the general plans, at which time Link drew a rough plat or map of the country showing

the possibility of the tunnel and its three collection or supply ditches. Subsequently reconnaissances were made by Link and Akin and the general plan for the enterprise was adopted and arrangements were made for the beginning of surveys.

Before any surveys were commenced Link and Akin adopted a general well-defined plan of action and outlined the tunnel system substantially as it is partially constructed today (1931-4). The tunnel was the first and most important unit of the system, provided sufficient water could be carried to its west portal to warrant the enormous expenditure of money required in its construction. Hence it was that these gentlemen outlined three lines of canal to be constructed for the purpose of intercepting the waters on either side of the adjacent territory and carrying the same up-stream to the point where the west portal of the tunnel would be. A number of small natural lakes in the vicinity of the upper of the three collection ditches were to be utilized as reservoirs for storage and regulation of flow of the water through the canals. Considerable time was spent upon the ground and particularly along the line of the upper canal, the construction of which presented the first problem for solution (1937).

The initial suveys were commenced upon a system already carefully planned and the first engineering was naturally done upon that part of the collection ditch system which still presented the most serious problems of engineering and construction. If this Upper Rawah ditch should prove to be feasible the remainder of the system, which was more exposed to view, seemed practicable (see Link, pp. 1929-2036; Akin, pp. 2038-75).

August 25, 1902 (1929-35; 2039-42), initial surveys upon the tunnel enterprise of the Greeley-

Poudre system were commenced by engineer Frank Beach under the direction and with the assistance of his employers, Link and Akin, and the engineering work continued until the close of the working season of that year (1933, 1938-9, 2039). This is the date of the priority of the Greeley-Poudre system established by the district court of Larimer County, Colorado (Ex. 179).

The mountain wilderness in which the tunnel project and its collection ditches and reservoirs is located and the early history of the enterprise are reviewed at length in our original brief, Vol. II, pp. 133-163. Briefly, the tunnel, collection ditches and reservoirs are located high in the mountains, remote from settlements and in a region where all labor and supplies have to be transported over mountain roads by wagons and teams for a distance of 80 miles or more from the nearest railroad stations at Laramie and Tie Siding, Wyoming and Fort Collins, Colorado (1404, 1619, 1755). Climatic and physical conditions are such that work is limited to from 90 to 120 days in each year. During the rest of the year the snowfall is so heavy that no open work can be done (2077). A considerable portion of the country is heavily timbered and all of the construction, following clearing the way, involves the excavation of rock and other similar materials. In fact the region is in all respects to be contrasted rather than compared with plains areas.

As stated, the original surveys commenced August 25, 1902, and were continued until the party were driven out by snow (1933, 1930, 2039). Realizing that if the collection ditches and reservoirs were impracticable insufficient water would be available to warrant the enormous cost of tunnel construction, Link and Akin directed their first efforts to sur-

veys of these collection units, and, as we shall hereafter observe, finally covered the 1902 and successive surveys in complete record filings for the tunned and all the other units in 1904 and began the first actual excavation in June, 1904, upon a short canal to be used for carrying the water obtained from the Upper Rawah collection canal to the tunnel.

With the opening of the short working season of 1903 Link and Akin proceeded with the construction of wagon roads into the remote mountainous region where the furthermost collection canal (Upper Rawah Ditch) must necessarily be constructed. These wagon roads must first be constructed to permit transportation of men, supplies, machinery, etc. (1942-45; 2042-43.) The whole of the working season of 1903 was occupied with this road construction so necessary to further engineering or construction work.

March 17, 1904, Engineer R. Q. Tenney and party commenced the first survey of the tunnel unit of the system, previous surveys having been extended to the upper collection ditch, the practicability of which was the first essential element in determining the feasibility of the tunnel project (1822, 1847-50, 1936-7, 2045-46, Ex. 75).

Immediately following the R. W. Tenney survey, Zac T. Duvall, an irrigation engineer of wide experience, continued the surveys, assisted by R. Q. Tenney. He and his party commenced work May 22, 1904 and were continuously engaged during the entire working season of 1904. The results of their efforts were later incorporated into a certain filing map, a copy of which was herein introduced as defendant's Exhibit No. 75. As observed by Mr. Duvall, this map merely sets forth those units actually

surveyed by Mr. Duvall and did not attempt to include any previous or other surveys.

It is interesting to note that the Greeley-Poudre tunnel subsequently completed for The Greeley-Poudre Irrigation District is upon the same location selected by R. Q. Tenney in March 17, 1904 and Zac T. Duvall in May of that year, before any actual excavation, other than the building of roads, had taken place upon any unit or part of the tunnel system and its three collection canals (See Defts. Orig. Brief, Vol. II, pp. 138-63, including all page references), and further, that the three collection canals were finally constructed upon the lines fixed by Mr. Duvall in 1904 with some minor changes in methods of carrying the water to the tunnel; and that the first of these to be constructed was the upper line situate in the most remote region and involving the most difficult engineering problem. There were some minor departures from the original lines of the lower west side collection canal, principally that of substituting tunnels and further ditch lines for inverted syphons, but such changes had no effect upon the general plan of the system.

Before continuing further we should again note that the first actual excavation took place in 1904 and that this work was not performed upon any of the three collection canals, but, on the contrary, at a point low down in the Laramie River Valley and at a much lower elevation than the Upper Rawah Ditch or the Skyline Ditch of The Water Supply & Storage Co. A short canal some 500 or 600 feet long was constructed to connect the East and West forks of the Laramie River so that the water flowing down the West Fork of the stream from the Upper Rawah Canal, could be conveyed directly to the portal of the tunnel. Water was turned into this canal July 10,

1904, prior to any excavation upon the Upper Rawah or any other canal of the sytsem (1885).

The construction of this short canal is a complete answer to any contention of plaintiff's counsel that the Upper Rawah ditch was merely an extension of the Skyline Ditch of The Water Supply & Storage Co. and had no connection with the tunnel project, or that the original plan contemplated the permanent use of the Skyline canal for carriage of water from the Upper Rawah ditch. If such had been the plan it is evident that this short canal, constructed at a location of 1,000 feet lower in elevation than the Skyline ditch and at the immediate west portal of the tunnel location, would not have been the first to be built upon the system. Very evidently any such expenditure of time or money would have been useless and of no purpose had any other than the tunnel plan been the ultimate object from the outset, and this fact becomes more apparent by consideration of all the testimony concerning the Upper Rawah Ditch which is fully discussed on pp. 171-186, Vol. II, Defts. Orig. Brief.

The deep snow at the higher elevations prevented Duvall from commencing final surveys upon the Upper Rawah Canal until July 4, 1904. After that date both survey and actual excavation proceeded upon that unit of the tunnel system.

The work done in 1903, 1904 and 1905 is described in detail by the witness, Duvall, in his testimony (1874, 1906), and in the testimony of Wallis Link (1907, 1998), A. I. Akin (2038, 2075), and others, and photographs of the 1902, 1903, 1904 and other work are in evidence. This evidence is all reviewed in our original brief, Vol. II, pp. 138-163. It would seem unnecessary for us to again go into details in this brief.

Of the work done in the years 1905 and 1906, we have the testimony of the witnesses, Link and Akin and othered above mentioned, and in addition thereto the testimony of the engineer, Charles R. Hedke, who became connected with the project, more particularly with the tunnel surveys, as consulting engineer in March, 1904. In 1905, he entered actively upon the work connected with this system and his testimony is of particular interest as all surveys and construction were under his direction from 1905 until February of 1911, after which time he did no field work on the Greeley-Poudre project, but perfromed services from time to time as consulting engineer. His testimony covered a wide range of discussion involving the surveys, plans and work done upon this system. (Hedke, 1723 to 1873, incl.)

During the seasons of 1905 and 1906 the work proceeded. Surveys were continued and made more in detail for the purpose of determining definite locations, cross sections, etc., of other units of the enterprise. In addition to the work on the Laramie River, surveys and other work were proceeding in the Poudre Valley. While the work in the Laramie River involved the problem of securing the water, that in the Poudre Valley involved the question of application, and consideration was given to several possible plans (1748.) As these plans devolved, Link and Akin and their later associates, determined upon reclamation of the lands now embraced within the territorial limits of The Greeley-Poudre Irrigation District. The reclamation of a portion of these lands had previously been undertaken by means of the "Poudre Valley Canal" diverting water from the Poudre River. The upper portion of this canal had been constructed in 1901 but it failed to reach the lands and was thereafter used as a feeder for

certain reservoirs. The continuation and extension of this canal was undertaken. It is now the main canal of The Greeley-Poudre Irrigation District (1735-9). After 1905 a portion of the work upon the system was prosecuted upon the Poudre Valley units. During 1904, Wellington Hibbard also became interested in the tunnel enterprise and upon him fell the greater part of the burden of financing this gigantic reclamation project (1963). Under his management arrangements were made whereby the water to be diverted from the Laramie River could be carried through the Poudre Valley Canal to the lands now included within the irrigation district (2053).

Witness Akin testified that up to October 1906, $31,738.90 (2053), had been expended by himself and his associates on this enterprise, and in addition, they had expended $4,998 in the purchase of necessary property on the Laramie River.

During the years 1902 to 1906 the title to the system was vested first in Wallis A. Link and A. I. Akin. In the early spring of 1904, Myon Akin and Wellington Hibbard became interested (2045). In September, 1906, the title passed to a company composed in part of these men, known as The Laramie Reservoirs and Irrigation Company (2055). March 19, 1907, the defendant, The Laramie-Poudre Reservoirs and Irrigation Company was organized and succeeded to all the rights, title and interest of The Laramie Reservoirs and Irrigation Company.

Following the organization of The Laramie-Poudre Reservoirs and Irrigation Company the work upon the entire system, both on the Laramie River and in the Poudre Valley, progressed much more rapidly. Engineering plans were worked out in further detail, construction gangs continued excava-

tion in the mountains, at first in large part upon the Upper Rawah Ditch (2054-2060); upon the large canal upon the plains of the Poudre Valley, and upon all parts of the system, and wagon trains were freighting from the railroads at Fort Collins and Laramie City and upon the plains.

During the season of 1907, from $40,000 to $50,000 were expended on the Upper Rawah Canal and Laramie River portion of the system (1795, 2053). On the line of the extension of the Poudre Valley Canal (now the Greeley-Poudre Canal) construction work was carried on throughout the year upon a section of from 30 to 35 miles in length (1768 to 1770, 2069-64).

In 1908 the work still continued although it was probably not pushed so vigorously as in the year 1907, because of the fact that the financial situation in the fall of 1907 interfered with the plans of the company for securing money for construction.

During the year 1907 and to March 1908, $129,572 were expended on actual construction and about $250,000 for all purposes (2064.) (See Defts. Orig. Brief, Vol. II, pp. 138-163).

During 1908, D. A. Camfield, a man who had had extensive experience in irrigation enterprises, entered the company (2138-57.) He testified that after making an investigation of the project and considering the possibilities from every standpoint, he bought 23 per cent of the stock in The Laramie-Poudre Reservoirs and Irrigation Company then engaged in construction of the system.

At the time Mr. Camfield purchased into the concern, approximately $800,000 had been expended for all purposes upon the system, so far as it had been completed (2159). Through the efforts of Mr.

Camfield, the lands which it had been theretofore designed to irrigate by means of this system, were formed into The Greeley-Poudre Irrigation District (2160), one of the defendants herein, and on Sept. 8, 1909, a contract was entered into between the irrigation district and The Laramie-Poudre Reservoirs and Irrigation Company whereby that company was to complete its project (under construction since Aug. 25, 1902) and turn the same over to the irrigation district for a payment of $5,000,000 of the bonds of the district, the payments for future work to be made upon monthly estimates as the work progressed (2161). Arrangements were made whereby these bonds were sold to a banking house in Chicago.

Construction upon the tunnel unit of the system was organized (2162). A controlling interest was purchased in the Poudre Valley ditch. Prior to this time merely a carriage right had been held in this canal (2162). A hydro-electric power plant on the Poudre side of the tunnel was established at a cost of $97,000 in order to furnish light and power for the construction of the tunnel (2163). All supplies and machinery used in its construction had to be transported by wagon from Fort Collins and Laramie (1648, 1649). A transmission line about three miles in length was run over the divide between the Poudre and Laramie Rivers and the work of drilling the tunnel was commenced at both ends. Large camps resembling electric lighted villages were established at both places, and the work prosecuted continuously day and night until the great tunnel was completed. The two bores met in July, 1911 (1652).

Plaintiffs in their supplemental brief comment upon the contention that it was impossible to do work upon the collection ditches upon the Laramie River

in the winter time, stating that this is contradicted by our own testimony showing that work was done on the tunnel throughout the winter months. It will be obvious without explanation, that the protected tunnel work could be carried on during the winter months under conditions which would absolutely prevent the construction of ditches out in the open.

The power plant and the tunnel, together with the concrete linings placed in portions of it, cost about $600,000 (1652). The tunnel is 11,366 feet in length and passes clear through the range of mountains. It is 7½ feet high and 9¼ feet wide (1647).

In the meantime the work of mountain canal construction, more particularly the construction of the East Side and West Side collection ditches, was continued during the working season, until October, 1910. These canals, as we have previously described, run along the side of the mountains on each side of the Laramie River Valley, practically conducting the water of tributary streams up the channel of the Laramie River to the reservoir. The construction is not only extremely difficult, on account of the inaccessible location, and very slow of accomplishment but is also very expensive owing to the fact that a large percentage of the work must be done in rock (1658, 1663).

It must not be overlooked, however, that the work done upon the system in the Poudre Valley is just as essentially a part of this whole project, as is the work on the Laramie River. The diversion of water from the Laramie River into the Poudre River, would not of itself irrigate the lands of this district. In the first place there was not a sufficient quantity, and in the second place, the diversion ditches from

the Poudre River and storage reservoirs in that area have to be constructed.

The water from the Laramie River is by no means a sufficient amount for the irrigation of the 125,000 acres of land included within the district, an additional supply had to be obtained from the Poudre watershed. This problem had been made the subject of special study by Prof. Carpenter and covered by a report made in 1909, confirming the conclusions which had previously been reached as to the water supply, upon which plans had been made and a vast amount of construction done (3933-3957). Professor Carpenter reported at that time, that there was an average amount of 120,000 acre feet of water in the Poudre river represented by the peaks of the flood flow, in excess of prior claims from that stream alone but without taking any account of the then existing and prior claims upon this excess water by canals upon the principal stream (South Platte), below the mouth of the tributary (Cache la Poudre). He explained, however, as has been commented upon by plaintiff in its supplemental brief, that there were unusually high floods which it was impracticable to intercept and impound, because of the uncertainty of these flows, and the further fact that no ditch capable of diverting them would be justified, even though no claims existed upon the South Platte, inasmuch as these flows were of short duration and any diversion system would have to be built of enormous size in order to intercept a very high flow of usually short duration. He therefore states that of the 120,000 feet excess in the Poudre River, possibly 60,000 to 90,000 acre feet might be made available to the lands of the irrigation district, having no regard to South Platte claims. In some seasons these prior South Platte claims may consume all the excess flow of the Cache la Poudre.

The plan for the irrigation of this district included a large reservoir to be constructed in the channel of the Poudre River in the mountains. It is obvious that such a reservoir, if large enough, like the Wheatland Reservoir No. 2, is capable of intercepting peak flows and equalizing the distribution (3936).

There are some streams of intermittent or flood flow entering the Poudre River from the north on the plains area. These are merely torrential streams, with the exception of possibly one, Crow Creek, which rises in Wyoming, and flows into Colorado. This stream is the one from which the City of Cheyenne takes its water for domestic purposes. As a rule it does not discharge water into the South Platte River, the small quantity which it carries normally being intercepted largely in the State of Wyoming, although Professor Carpenter explains in his discussion of inter-watershed appropriations, the appropriators in Wyoming are junior to the appropriations in Colorado on this stream. (This is the same stream involved in the recent case of Grover Irr. Co. vs. Lovella Ditch Co., 9 Wyo. 110, wherein Colorado citizens were denied easement for using waters in Colorado which rise and flow in Wyoming. This decision was made since Prof. Carpenter's report.)

It was planned, however, to intercept, as far as possible, the floods occurring occasionally in these streams.

Professor Carpenter's estimate as to the available water for the Greeley-Poudre District may be summed up as follows: From the Laramie River, 70,100 acre feet; from the Poudre River 60,000 to 90,000 acre feet (without consideration of South

Platte Claims); from Doudy Lakes, that being a system of lakes lying in the mountains on the Poudre side which from a part of the reservoir system of the district, 2,990 acre feet; from Douglas reservoir, which is a reservoir already existing in which the Greeley-Poudre district has an interest, 5,833 acre feet; and from flood waters of Lone Tree and Crow Creeks from 3,000 to 10,000 acre feet, making a total of 142,000 to 179,000 acre feet (3936). The water of Lone Tree and Crow Creek are now denied Colorado users by Wyoming). It must be remembered that the Laramie River water estimated as an amount of 70,100 acre feet is based upon estimates of the quantity at the tunnel, from which point it is subject to unavoidable loss by evaporation as it flows through the canyon of the Poudre River and by unavoidable seepage and evaporation through the diversion ditch to the lands of The Greeley-Poudre Irrigation District. However, the natural loss through the canyon of the Poudre would probably be no greater than a similar loss in the Laramie River from the tunnel to the Laramie Plains. This total does not represent the net amount available for application upon the lands of the district, but rather, to the amount estimated to be available at the points of diversion. The seepage losses from canals would be probably no more than similar losses from the Wheatland canals in Wyoming.

All of the available water from both the Poudre drainage and the Laramie River is necessary for the irrigation from year to year of the lands within the Greeley-Poudre district (1708).

Moreover, inasmuch as the Poudre River is but a tributary of the South Platte, and there are ditches diverting water from the South Platte river below

the mouth of the Poudre within the State of Colorado of earlier date than some of the Poudre Valley ditches and many of its reservoirs, and much earlier than the Greeley-Poudre system, there is at times a demand for water on the part of these lower South Platte ditches which necessitates the closing of headgates on the Poudre, in order to supply the demand of the lower canals (3411). This may result in the appropriators of water from the Poudre closing their headgates at a time when, if the Poudre River were considered alone, there would be available water for their needs.

Very briefly the system of works in the Poudre Valley necessary for the irrigation of these lands in The Greeley-Poudre Irrigation District consisted of the construction of a canal many miles in length from the end of the Poudre Valley canal, which we have previously described, to and along the upper boundary of the lands of the district, together with several branches necessary for the proper distribution of this water, and the construction of several reservoirs. These reservoirs secure the greatest economy by regulating and equalizing the flow of the canals so as to deliver the water only when needed by the farmers and also assure annual production by storing the water of high years for use in years of low flow in the streams. Of these, the Doudy Lakes, just mentioned, were already in existence, so also was Douglas reservoir, owned only in part by the district. In addition to these, the plan called for the construction of the reservoirs known as McGrew Lake, March Reservoir, Camfield Reservoir and several other smaller reservoirs situated in the general vicinity of the lands of the district, together with outlet canals whereby the water from these reservoirs could

be distributed, and also the construction of one large channel reservoir in the canyon of the Poudre River in the mountains. On the map, Exhibit 1, attached to the answer of the corporations named defendants herein, the works of this system, as planned, are clearly shown. A glance at this map, which shows both the Poudre River and the Laramie River drainage areas, will enable the Court to understand more clearly the discussion made in these briefs. On this map the reservoirs and ditches of the Greeley-Poudre system are colored red. It will appear that there are three channel reservoirs planned in the Poudre canyon. These were alternative sites then contemplated, of which only one, the middle or Elkhorn Reservoir will probably be constructed, as it is the more practicable.

The engineering and construction of the plains division, so called, of this system had been vigorously pursued since 1905 by The Laramie-Poudre Reservoirs and Irrigation Company, and its predecessors, at the same time work was progressing on the Laramie River and, under the contract with the district, all this work was to be pushed to early completion. It is contended in the supplemental brief of the plaintiff, that during the years 1905 and 1906, no construction work was in progress on the Laramie River end of the system, although it appears that detailed engineering was being done during those years. However, the work of the system as a whole was being conducted with regular continuity, commencing with the surveys of August 25, 1902, and the work developed naturally and increased as the financing of the project progressed. Concerning the work done in the Poudre Valley and the system as there planned, see particularly the evidence of the witness,

Wortham, engineer for the district, at pages 1699 to 1716, and that portion of the testimony of Charles R. Hedke, the construction engineer for The Laramie-Poudre Reservoirs and Irrigation Company at pages 1743 to 1855. This testimony of the witness, Hedke, shows the work done between the years 1905 and 1911 on the system as a whole. It is of interest to review his testimony of the amount of work which he found already done and the surveys already made by his predecessors on the Laramie River, when he took charge of the work early in the year 1905 (1745), confirming the testimony of the engineer, Duvall, who had made the earlier surveys, and witnesses Link and Akin.

It seems to be contended by the plaintiff that the work done on what is termed the Plains Division, has no bearing upon or relation to the diversions from the Laramie River. But this contention is erroneous. The system whereby the Laramie River water could be diverted from the Poudre River and applied to the lands of the district was absolutely essential and cannot be disassociated with the work on the Laramie. It is true that the system contemplated the appropriation of some of the water from the Poudre. Probably one-half or less of the supply must be obtained from that stream, but nevertheless, inasmuch as the ditch which diverts Poudre River water also diverts water which is added to the Poudre River by means of the tunnel and collection ditches, and inasmuch as the reservoirs designed to store the flood waters will in a measure store water both from the Poudre River and that added from the Laramie River, it follows that the plains division of the work is inseparable from the mountain division and the system must be treated as a whole.

Without tracing further the detailed history of the Greeley-Poudre System, we will state that the work progressed with greater vigor subsequent to 1908 than previously both upon the Laramie and Poudre Rivers and the Plains Divisions of the work. Crews of men and equipment were everywhere at work from the collection ditches in the mountains to the lower end of the great canal (2162), and this work was progressing in full force to an early completion when its final progrees was prevented by Wyoming and her citizens, culminating in the bringing and prosecution of this suit (2164-6).

The great tunnel is complete (1778), and the entire project in a considerable measure constructed (2124), but sufficient construction yet remains to prevent use of the entire system.

In our original brief, Vol. II, pp. 134-167, we have given a more detailed history of the project and there reviewed the evidence. We respectfully urge consideration of the facts there set forth.

We have endeavored to trace, step by step, in this and especially in our original brief, the history of the project, commencing with the time upon which Wallis A. Link conceived the idea of this diversion in 1897 and the first survey on August 25, 1902, down to the close of the suit.

The record shows the following:

Progress Upon Greeley-Poudre System.

(Commenced August 25, 1902.)

1902—Engineering during entire working season after August 25th.

1903—Road construction upon system during entire working season with activity all winter.

1904—Tunnel line definitely surveyed on locations selected in 1902 where tunnel is now completed.

1904-7—Active construction upon the enterprise, engineering continued. Up to October, 1906; $36,734.40 expended on the system (2053); up to March 1, 1907, $46,079.32 expended.

1908—By March, 1908, $296,079.32 had been expended in actual construction alone (See Vol. II, p. 162, Orig. Brief).

1908—$800,000 expended upon project for all purposes from initiation (2159).

1911—(Feb. 1) $1,825,000 (cash) expended on system to date (1779).

1913—More than $3,000,000 in bonds sold and proceeds expended on system (2130) and more than $900,000 had been expended on Laramie River portion alone.

(All the foregoing appears in detail, pp. 133-67, Vol. II, Defts. Orig. Brief.)

It would seem that at least "reasonable diligence" has obtained. We fail to find a similar degree of diligence displayed on the Wyoming projects, old or new, all the facts considered.

It will be remembered that the August 25, 1902 surveys were upon the line of the upper collection ditch which was also designed to tap some natural lakes known as the Link Lakes; that this ditch at first was called The Lake Link Ditch, and later the Upper Rawah Ditch; and that it was so constructed that a portion of the water which it intercepted might either pass down the West Fork of the Laramie to the tunnel or be from that stream diverted by the

Skyline ditch, and taken into Chambers Lake, and thence into the Poudre River.

In the original brief by Wyoming, counsel sought to show that because a part of the waters from this canal (of 224 cu. ft. per second capacity) might be diverted by the Skyline canal (of 130 cu. ft. per second capacity), it might be considered that the former canal was originally a separate institution from the tunnel enterprise. This they claimed was borne out by the filing which recorded the extent of the 1902 survey (stopped by snow). We made answer in full to this erroneous assumption in Vol. II, at pp. 171-186 of our original brief where we quoted the record in detail.

In this supplemental brief, counsel for Wyoming still seek to lead the Court to a misunderstanding of the facts to the extent of making a sketch map which appears on p. 45 of the brief, wherein they omit the course of the waters down the West Fork of the Laramie to the tunnel and substitute dotted lines between the lower canal (of 130 cu. ft. capacity) already diverting water from the West Fork, and the Upper Canal (224 cu. ft. capacity), thereby to leave the erroneous impression that the waters of the upper and larger canal, discharging for tunnel carriage lower down, are for carriage through the lower and smaller canal, already carrying its full capacity. Counsel further invent the name of "Skyline Extension" for this Upper Rawah Ditch of the Greeley-Poudre tunnel system. The record in this case, in large part quoted in Vol. II, pp. 171-186 of our original brief, and the decree of the District Court of Larimer County, Colorado (Deft. Ex. 179), reveal the facts. As we previously observed to try to carry the water of the larger canal through the

smaller would be like trying to fit a square peg into a round hole.

It is argued that, inasmuch as this ditch was the first one to be considered and the water, at least in part, could be temporarily taken through the Skyline ditch into Chambers Lake, there was not in the minds of the projectors any idea of a tunnel at the time of its original survey. But this contention is clearly disproved when the testimony of Link and Akin is considered. They both say it was merely a question of initial work of the system; that inasmuch as they did not have money to finance all of the work necessary to be done, there was in their minds a theory that some small part of the water from this Upper Rawah ditch, if temporarily taken through the Skyline Ditch and thence into the Poudre River, would furnish them, through temporary sale of this water, means with which the additional work on the tunnel could be carried on (1930, 1931). There was and is no carriage space available in the Skyline ditch during the season of high flow, May and June, so that it is obvious that no part of the water from the Upper Rawah Canal could be taken through to the Poudre River by that route at the very time when this Upper Rawah Ditch is capable of intercepting the greatest flow (2002). Moreover, the upper canal (Upper Rawah) as actually constructed in 1904 and thereafter, had a capacity of nearly 50% greater than the total capacity of the lower or Skyline ditch. These facts in themselves show that this method could not have been the basic idea in the minds of Link and Akin when they commenced work on the Upper Rawah ditch. Moreover, as we have shown, the surveys for the tunnel in natural sequence according to the plans as outlined, were made in the

year 1904, also the surveys for the East and West side collection ditches. Now where is there any ground for contention that the tunnel plan originated only after the formation of the Greeley-Poudre District in 1909? The tunnel as finally constructed was built upon the line located by Link 1897, adopted by Link and Akin in 1902 and definitely selected in the Tenney and Duvall surveys made in 1904.

We then find that in the years 1904 and 1905, additional persons, Mr. Myron Akin, and Mr. Wellington Hibbard became interested in the project and invested in it, and that a corporation including these original parties was formed, known as The Laramie Reservoirs and Irrigation Company. In the meantime the system developed as rapidly as conditions would permit. Later this corporation was succeeded by another one, The Laramie-Poudre Reservoirs and Irrigation Company, and in the spring of 1905 we find that Mr. Hedke, the engineer employed by this last named company, continued with the work of construction including not only the work on the Laramie River, but the engineering work necessary to develop the system on the plains. During 1906 and 1907 the work continued. In the year 1908, a powerful influence in the person of Mr. D. A. Camfield, who had previously constructed a number of other large enterprises for irrigation districts and the works for their irrigation, came into this project, at which time approximately $800,000 had been expended on this system. But Mr. Camfield, having financed his former projects through the organization of irrigation districts and issue and sale of bonds which are a charge upon the lands, entered The Laramie-Poudre Reservoirs and Irrigation Company and purchased stock therein upon the understanding that an

irrigation district would be formed to include the lands already long since selected for irrigation. Pursuant to this plan The Greeley-Poudre Irrigation District was formed early in the year 1909. This district is a public corporation organized under the laws of the State of Colorado. The lands included are subjected to a bonded indebtedness for the purpose of purchasing or constructing systems for the irrigation of the lands. Under this law the qualified electors of the district elect directors who manage the affairs of the district. The Greley-Poudre District when organized, made a bond issue of $5,100,000 (2161) and entered into a contract with The Laramie-Poudre Reservoirs and Irrigation Company, under which the district purchased the properties and the company was to continue to completion the work of construction then and theretofore in progress since 1902 and to turn the system over, completed, to the district. In the meantime payments in bonds were to be made by the district to the company on monthly estimates as the work progressed. The company in turn obtained the money to prosecute its work by the sale of these bonds to a banking house known as Farson Sons & Company, which had contracted to purchase these bonds as the same were delivered from the district to the company.

This plan gave to the project sufficient finances to enable the work upon the whole system to be prosecuted with greater progress and this was continued as has been described by these various witnesses, until the year 1911, when because of threats made by the plaintiff through various persons in Wyoming, or officers of that state, the market for these bonds was destroyed and the banking house of Farson

Sons & Company compelled to decline to purchase more of them. This suit followed these threats. This case was commenced May 29, 1911, and from that time on it has been impossible to obtain a market for these bonds and work on the construction of this system has progressed but little. However, the district has expended such money as it has been able to receive through taxation, in doing what it could do and in keeping the system intact until the outcome of this case, when a favorable decision will permit the district to obtain finances for the completion of the work necessary to be done in the irrigation of these lands, which, from experience, will produce a development like that already existing on the lands now under irrigation in the Poudre valley.

The financial embarrassment which occasioned the complete cessation of most of the work on this system is due directly to numerous letters sent out, and interviews given to the public press by persons in the State of Wyoming, seeking to discredit the financial responsibility of The Greeley-Poudre Irrigation District, and also its ability to obtain water, particularly from the Laramie River for irrigation, followed by the initiation of this suit (see evidence, pp. 2164; 3682 to 3689; 3668 to 3670). When this condition was reached and when, because no more bonds could be sold, The Greeley-Poudre Irrigation District and The Laramie-Poudre Reservoirs and Irrigation Company were compelled to temporarily discontinue the work of construction, the district had, and for that matter still has $2,340,000 of its bonds in its treasury. Three hundred thousand dollars worth of bonds were held in escrow for purposes not of interest here, and two million four hundred and sixty thousand dollars bonds have been expended upon this system (2165). These bonds are an outstanding lien

against the lands of the farmers of the irrigation district and are in the hands of innocent purchasers throughout the Central and Eastern States.

Moreover, in anticipation of the development of this tract of land, many persons had settled upon lands within this district, making improvements thereon and a number of small towns sprang up within the territorial limits of the district more particularly Pierce, Hungerford, Camfield and others. Banks and mercantile houses had been established and two lines of railroad had been built by the Union Pacific Railroad Company into the territorial limits of the district (3663-3665). These are merely a few of the items which might be mentioned showing the investments which have already been made in anticipation of the reclamation of this tract, all of which must come to naught, and this vast amount of money expended directly or indirectly on this project and in anticipation of its successful culmination will be lost and the holders of bonds to the amount of over two millions of dollars will lose their investment.

Nowhere, from the beginning to the end of the record in this case, is there a word so much as suggesting the abandonment of this project, or of any material portion thereof. The most that can be said is that as details were worked out, minor changes were made which is some instances eliminated small items of construction formerly under consideration. For Illustration: the construction of the dam for the tunnel eliminated the canal between the East and West forks of the Laramie River and also the pipe line leading across the valley from the West Side collection ditch, but not one of these items so eliminated, can be considered to be an aban-

donment. They are nothing more or less than a change in mere details.

The work of construction was proceeding rapidly when brought to a halt through no fault whatsoever of the defendants, but due to the alarm which had been occasioned by the threats publicly made by the citizens of the plaintiff state. We are not so foolish as to say that the plaintiff had no right to institute a suit if it felt that its rights were in jeopardy, but we do say that it comes with very bad grace for the plaintiff to contend that from the time when the work ceased in the year 1911, no substantial construction work had been done upon this system, and that therefore the original date of priority had been lost when the uncontradicted testimony shows that the cessation of work and the inability to resume it are due entirely to the acts of the plaintiff or citizens of that state.

Let us refer briefly to the history of some of the Wyoming projects, to learn what diligence has been shown in bringing about the beneficial application of water there. The Wheatland system for the irrigation of the Wheatland tract, consisting of 60,000 acres, had its inception in the year 1884, according to the plaintiff, and yet, in the year 1913 only fifty per cent of the land in that tract had been brought under irrigation; and yet this plaintiff under the doctrine of relation is contending for an appropriation as of date 1884, for the irrigation of 60,000 acres of land.

We have previously noticed the fact that although surveys for diversion ditches for the irrigation of the Bordeaux tract had started in February, 1904, nevertheless, in the year 1913, when the evidence was taken, only 1,004 acres, according to the plaintiff's witnesses, was under irrigation in that

tract. The surveys for the system designed for the irrigation of the Sybille tract of 30,000 acres, were commenced in August of 1907. This ditch is only 16 miles in length, and yet in the year 1913, it was not completed, and no lands whatsoever had been irrigated in the Sybille tract. Again the Lake Hattie and Lake James projects, initiated in the year 1908, and substantially completed when the testimony was taken, has been used for the reclamation of only a nominal amount of land. The Hutton Lake project, commenced in the year 1909, was not yet completed. Each one of these Wyoming projects is relatively simple of construction, readily accessible and of small cost compared with the Greeley-Poudre system. Under the laws of all states where the doctrine of appropriation obtains, beneficial use is the one chief requisite of an appropriation. It is recognized, however, that beneficial use cannot be made until the water is diverted from the stream. Such diversion works as are necessary must first be constructed. Therefore, under the doctrine of relation, when water has been beneficially applied and an appropriation thereby established, the date of that appropriation relates back to the inception of the work necessary to be done in order to make that beneficial application, provided due diligence has been exercised in the construction of such works. What is due diligence under every decision upon this point depends entirely upon the circumstances. It is a question of fact. The Greeley-Poudre system could not be built in a day, nor in a year. It is a stupendous undertaking, designed for the irrigation of an enormous tract of land—one hundred twenty-five thousand acres—with the place of application far remote from the

source of supply, involving engineering efforts which are almost startling in their daring. But we have shown a continuity of effort without interruption from the inception of this project, commencing with the date of the first survey, August 25, 1902, continued until forced to discontinue through the efforts of the very people who now claim lack of diligence on our part. But if there be such a lack of diligence as to destroy the right of the Greeley-Poudre system to its original date of appropriation, August 25, 1902, as contended for by the plaintiffs in their supplemental brief, what will be said of the Wheatland tract where an appropriation was made as of the year 1884, with subsequent enlargements, upon which a decree has been based adjudicating them water for the irrigation of 60,000 acres of land, when during a period of 29 years they had made beneficial application of this water upon only fifty per cent of the area for which this water was decreed. It is true, the Wheatland people made the diversion, but where is the beneficial application upon which that diversion must stand if it be entitled to its priority date? The same thought is likewise applicable to the other Wyoming projects we have just mentioned. Manifestly Wyoming is not in any position to complain of a lack of diligence in the construction of the Greeley-Poudre system.

VIII. CONCLUSION.

In concluding this brief may we suggest that we have endeavored herein to reply to the plaintiff's supplemental brief, rather than to present all of our defenses. In our original brief the salient features of the whole case were discussed and the evidence

reviewed. We sincerely trust that the order for re-argument does not mean that this original brief is out of the consideration of the Court. For many features of the case we must refer the Court to that discussion, and this present effort is not intended to supplant our first brief, but rather to supplement it. Since the original briefs were filed the Court has heard the oral arguments, made in December, 1916, and some of the facts, particularly the geography of the situation, are already before the Court. We trust that our review of the evidence herein and in our original brief will enable the Court to understand the questions of fact necessary for the consideration of this case.

Our general conclusions may be summarized as follows:

That the date of the commencement of the work complained of is August 25, 1902; that prior to that date, the only appropriations of water from the Laramie River in Colorado, were those made through many small ditches for irrigation of 4,250 acres of mountain meadow lands, adjacent to the streams, where the water, because of the character of the lands irrigated, returned with slight loss immediately to the stream, which diversions are so non-consumptive that no charge was made against the flow of the river on their account by the experts, as likewise obtained with regard to those diversions above Filmore in the area called the Centennial Valley on the Little Laramie River in Wyoming; that in addition to the use of water on these mountain meadow lands in Colorado, prior diversions had been made from the river by the Skyline and Divide ditches in Colorado in the aggregate average amount of 20,000 acre

feet per year, and that these three items, the mountain meadow irrigation, the Skyline ditch and the Divide or Wilson supply ditch, define the total benefits the State of Colorado had derived from the use of water from the Laramie River for irrigation prior to August 25, 1902;

That the total flow of the Laramie River at the Colorado-Wyoming line amounts to an average of from 250,000 to 320,000 acre feet per annum, this including the amount of 20,000 acre feet diverted by the Skyline and Divide ditches;

That the diversion through the Greeley-Poudre tunnel system here sought to be enjoined, will amount to an average of 56,000 acre feet per annum, according to the system as planned and in part constructed, with the probability of this being enlarged by the extension of the West Side Collection Ditch to divert an additional amount of 15,000 acre feet from McIntyre Creek, making a total of 71,000 acre feet per annum. If this cause should result in a decision favorable to defendants, Colorado will then be permitted to use the 20,000 acre feet now being diverted and a probable additional 71,000 acre feet through the Greeley-Poudre tunnel system, or a total of 91,000 acre feet per annum out of the minimum average flow of 250,000 acre feet per annum of the waters of that branch of the Laramie River rising and flowing within the State of Colorado. In other words, Colorado will be permitted to divert from the Laramie River but 91/250 of the water of that stream and its tributaries rising and flowing within her borders.

Passing now to Wyoming. The plaintiff in its supplemental brief contends that the total amount of

land under irrigation from the Laramie River in Wyoming is 152,097 acres, practically all of which was irrigated under projects begun prior to 1902. The defendants contend, and this is based upon a survey of practically all of these Wyoming lands, that the total amount under irrigation from the Laramie River in Wyoming is only 108,073.75 acres. We agree with Wyoming that the greater part of this was irrigated under systems initiated prior to August 25, 1902. As a matter of fact, the only lands which the plaintiff contends have been reclaimed since that date, excepting some small tracts under some unimportant ditches are as follows: Bordeaux tract, 1,004 acres; Lake James, 1,500 acres; Lake Hattie, 700 acres; Sodergreen, High Line Canal 4,000 to 5,000 acres; total, 7,204 to 8,204 acres, an inconsequential quantity, considering the whole. We are therefore justified in making the assumption that the greater part of the land under irrigation from the stream in Wyoming, is served by ditches initiated prior to August 25, 1902.

The Court has also asked that the extent of the use at the time that this suit was commenced be shown. There is no material difference in the amount of the use at that time compared with the amount of use on the earlier date, August 25, 1902.

We further contend that, including the Colorado water which we will place at the minimum average amount of 250,000 acre feet per annum, there are 431,200 acre feet of water in the Laramie River and its tributaries (including, of course, the amounts diverted above) available down to and including the Wheatland tracts, or if the flow from the North Laramie and the Chugwater be added, 470,000 acre

feet or more. If the higher estimate of flow at the state line be taken, that is 320,000 acre feet per annum, then the amount of the flow at the lower point of the river would be correspondingly increased. Taking for illustration the lower amount available for all lands down to and including the Wheatland tracts, 431,200 acre feet, Colorado seeks to divert by all her methods only 91,000 acre feet thereof, leaving 340,200 acre feet of water per annum available for the irrigation of Wyoming lands down to and including the Wheatland tracts, and more than that amount if Chugwater and North Laramie be added. It would appear that Wyoming will have an abundance of water for all of her legitimate needs, with a surplus available for future development, even after deducting the Colorado diversions. That in a year of normal flow, at least 15,000 acre feet of water above the legal amount which might have been diverted for irrigation under conditions demanding the greatest amount of water needed in that state, was diverted and applied to the lands in the Wheatland tracts, and yet, they had 40,000 acre feet remaining in the Wheatland No. 2 Reservoir at the close of the irrigation season. That water to unknown quantities has been wasted on the Laramie Plains by needless running of the same in canals during the winter months, by being impounded in reservoirs or waste basins from which there was no outlet and many other methods of unnecessary waste, thereby revealing water far in excess of all needs or demands (see Vol. I, pp. 299-307). That in the year 1912 four reservoirs alone, that is, Lake James, Wheatland Reservoir No. 1, Wheatland Reservoir No. 2, and Lake Hattie received 156,600 acre feet of water in storage, above the loss

by seepage and evaporation, which was not used or withdrawn, this representing surplus water which remained after use, loss and waste.

We have shown that the duty of water on the Laramie Plains, according to Wyoming's expert upon the subject, is one acre foot per acre, and on this basis, Wyoming has enough water in the Laramie River, considering the total to be 470,000 acre feet per year, to irrigate 379,000 acres of land after Colorado has diverted the amount which she seeks to divert, that is, 91,000 acre feet.

Wyoming contends that her supply is limited to an average of 200,000 acre feet on the Big Laramie and 110,000 acre feet on the Little Laramie, or a total of 310,000 acre feet. The measurements by which this conclusion was reached did not include the 20,000 acre feet diverted through the Skyline and Divide canals in Colorado. In other words, the estimate of 200,000 acre feet made by the Wyoming expert as the average amount at the state line, was the net amount of water at that point. Assuming for the sake of argument alone, that this is the total supply which Wyoming has, and there be deducted from it the 71,000 acre feet to be diverted by the Greeley-Poudre system, there would remain for usein Wyoming, 239,000 acre feet, or sufficient under the duty of water established by this same witness, for the irrigation of a corresponding number of acres of land. The plaintiff contends that she has 152,097 acres under irrigation. The surveys revealed but 108,073.75 acres. But even if their claim of acreage were correct, determined as it was by approximation, it appears from the plaintiff's own evidence that there is more water than is needed for the irrigation

of the lands now under irrigation and a surplus for future development.

The Court has also asked that the extent of appropriations made, or authorized in either or both states since the commencement of the suit, be given. In answer, we say that no appropriations have been made from the Colorado branch of the Laramie subsequent to the commencement of this suit, nor in fact, subsequent to the Greeley-Poudre enterprise (Aug. 25, 1902). The extent of the appropriations authorized in Wyoming since the commencement of the suit, is rather incomplete and the evidence was not taken with a view to this line of declaration. This suit was filed May 29, 1911. The evidence discloses that a number of filings have been made with the State Engineer of Wyoming for large projects since that date, upon which permits have been issued. So far as we are advised, none of these were constructed, nor even in the course of construction when the evidence was taken. These were shown in part by defendants' exhibits as follows: Permit No. 2719 Enl., filed July 11, 1912, for Pioneer High Line Canal enlargement of Lake Hattie supply canals taking water from the Big and Little Laramie Rivers and providing for use of water from the new Lake Hattie enterprise by a system of exchange with the river; Exhibit No. 160; and Permit No. 2720 Enl., filed July 11, 1912, for the Lake Hattie supply No. 2 enlargement, taking water from the Little Laramie River, Exhibit No. 167. However, there are doubtless others. Plaintiff offered no testimony concerning recent enterprises granted permits. So to have done would have been to admit that still unappropriated water remained in

the stream and thereby to deny their own contention of injury. The defendants limited their proof of recent permits and admission of abundant water supply by Wyoming, to those permits covering the new large enterprises which Wyoming witnesses, on cross-examination, admitted had been initiated long junior to the Colorado tunnel enterprise (3909-3933, 3958-62).

But there have been numerous projects initiated in Wyoming subsequent to the initiation of the work complained of, among them, those which we have previously discussed, that is, the Sybille and Bordeaux tracts, the Lake James system, the Lake Hattie system, the Lake Hutton system, the Sodergreen High Line and a great many others which need not be mentioned. All of these are based upon surveys commenced long subsequent to August 25, 1902, and have received permits from the State Engineer of the State of Wyoming authorizing construction (see defendants' Exhibits 159 to 178, inclusive, and pages 3893 to 3933, inclusive).

In Volume II, of our original brief, pages 198 to 231, inclusive, we discussed these recent and junior Wyoming appropriations in detail. On pages 214, 215, 218, 219, 220, 227 and 228 the permits are set forth in detail.

By the statutes of Wyoming the State Engineer is forbidden to issue permits authorizing diversions from streams where no unappropriated waters remain (3917-18, Revised Statutes of Wyoming, 1910, Secs. 727, 728 and 729), and Elwood Mead, the first State Engineer of Wyoming, and to whom is due the credit of the permit system obtaining in that State, in the first biennial report of the State Engineer, 1891-2, states: "An approved permit is a guarantee

from the State * * * that the engineer believes that there is an adequate water supply'' (3918).

The foregoing permits authorizing the construction of these large junior Wyoming enterprises, having been issued by the State Engineer, are a declaration upon the part of the State that sufficient unappropriated waters remain in the stream to supply the new systems for which permits were granted, after supplying all senior appropriations.

It would seem that Wyoming is in no position to contend that the insignificant diversion to be made by the Greeley-Poudre tunnel system would materially affect senior appropriations in Wyoming in view of her declarations, by issuing permits, that ample water remains in the stream to satisfy the enormous new Wyoming projects many years junior to the tunnel project in Colorado.

Further discussion of the facts of the case already covered in our former brief and particularly in Vol. I, pp. 16-21 and Vol. II, pp. 131-255, would involve but continued repetition. Vol. I of this brief is devoted entirely to the law of the case as directed by the first paragraph of the order for re-argument. We shall not here add to the conclusions there stated.

We therefore conclude:

That more than 250,000 acre feet of water annually rise and flow in the Colorado branch of the Laramie River and that of this amount, the State of Colorado will be unable to divert more than 91,000 acre feet or to make use of more than 91/250 of the waters naturally rising and flowing within her borders; that an average of 470,000 acre feet of water annually rise and flow in the Laramie River in both

Colorado and Wyoming, and that Colorado will be unable to use more than 91/470 of the flow of the stream.

That 108,073.75 acres of land are irrigated from the Laramie River and tributaries in Wyoming, and that after Colorado shall have diverted 91,000 acre feet of water from that branch of the stream which rises and flows within her borders, there will ever remain in the stream sufficient water to supply the acreage now under irrigation in Wyoming and ample for all present and future diversions within her borders;

That the tunnel enterprise in Colorado was initiated August 25, 1902, and that long subsequent to said date many large, new and junior enterprises were first initiated and granted permits by the State of Wyoming, thereby admitting that ample water still remained in the Laramie River and its tributaries to supply said new and junior enterprises after satisfying all senior appropriations; and that the Coloado enterprise is senior and superior to said subsequent enterprises in Wyoming and senior and superior as against any additional or enlarged claims upon the stream for reclamation of additional acreage by means of Wyoming appropriations prior to August 25, 1902;

That while in Vol. I of this brief, pp. 215 to 319, inclusive, we observed that the general principles of prior appropriation are *intrastate* in their application and do not apply irrespective of state lines, nevertheless, if the doctrine were sought to be here applied, plaintiff has failed to offer sufficient proof for adjudication of water rights from this interstate stream or upon which this Court could determine the relative priorities of the several diversions in the two States and settle the same by decree;

That the diversions by Colorado and her citizens and the exercise by Colorado of her sovereign rights in the necessary use of her natural resources and a part of the waters of that portion of the stream which rises and flows within her borders will not injure the State of Wyoming or her citizens or interfere with Wyoming in the exercise of her sovereign rights;

That the State of Wyoming has wholly failed to prove the allegations of her bill or that diversion by the Colorado enterprise complained of will in any manner injure Wyoming or her citizens, and that the action should be dismissed.

Respectfully submitted,

PLATT ROGERS,
FRED FARRAR,
Of Counsel.

LESLIE E. HUBBARD,
Attorney General of the State of Colorado;

DELPH E. CARPENTER,
Attorney for The Greeley-Poudre Irrigation District;

JULIUS C. GUNTER,
Attorney for The Laramie-Poudre Reservoirs & Irrigation Co.

STATE OF WYOMING *v.* STATE OF COLORADO ET AL.

IN EQUITY.

No. 3, Original. Argued December 6, 7, 8, 1916; restored to docket for reargument March 6, 1917; reargued January 9, 10, 11, 1918; restored to docket for reargument June 6, 1921; reargued January 9, 10, 1922.—Decided June 5, 1922.

1. The waters of an innavigable stream rising in one State and flowing into a State adjoining may not be disposed of by the upper State as she may choose, regardless of the harm that may ensue to the lower State and her citizens. P. 466.
2. The relative rights of two adjoining States to the use of an innavigable interstate stream, must be determined in accordance with right and equity and in harmony with the constitutional principle of state equality. Pp. 465, 470.
3. This does not imply an equal division of the water between the two States. P. 465. *Kansas* v. *Colorado*, 206 U. S. 46.
4. The doctrine of appropriation, by which priority of appropriation gives superiority of right, affords the only equitable basis for determining this controversy, in which Wyoming seeks to prevent diversion of water from the headwaters of the Laramie River in Colorado for use in irrigating Colorado lands, to the detriment of prior irrigation appropriations made from the same stream in Wyoming. P. 467.

So *held*, in view of the early adoption and continual practice of the doctrine in both jurisdictions alike, sanctioned by the United States as owner of the public lands, its perpetuation in the constitutions of both States at the times of their creation as a doctrine already existing and essential to their natural conditions, its relation to the settlement and irrigational and agricultural enterprises in both, and the recognition in both of the right to appropriate water from interstate streams.

5. In applying the doctrine of appropriation in this case, private appropriations should be recognized in the order of their priority, as they would be if the stream lay wholly in either State. Pp. 468, 470.

6. Such recognition of private rights *held* not inappropriate in a suit between the two States, in view of the relation of the appropriations to taxable values, and to the welfare, prosperity and happiness of people in each State. P. 468.

7. In as much as the doctrine of appropriation, as it exists within these two States, was adopted, and practised from the beginning, with the sanction of the United States as owner of the public lands, and in as much as the United States does not now seek to impose any policy of its own choosing on either State, the question whether, in virtue of such ownership, it might do so, is not here considered. P. 465.

8. The fact that the proposed diversion is to another watershed from which Wyoming can receive no benefit is not in itself a valid objection, since like diversions are made and recognized as lawful in both States. P. 466.

9. The doctrine of appropriation lays upon each State a duty to exercise her right reasonably and in a manner calculated to conserve the common supply. P. 484.

10. The evidence establishes:

(*a*) The average yearly flow of the Laramie River, in Wyoming, is not a proper measure of the supply practically available there from year to year. P. 471.

(*b*) Computation should be based on the unalterable need for a supply that is fairly constant and dependable, or susceptible of being made so by storage and conservation within practicable limits; substantial stability of supply being essential to successful reclamation and irrigation. P. 480.

(*c*) The reasonable measure of the supply available in Wyoming for practical use is not the lowest natural yearly flow, but something considerably greater, obtainable by storage. P. 484.

(*d*) So measured, the entire supply, from the Laramie and from certain tributaries in Wyoming, available for Wyoming appropriations here involved and for the proposed Colorado appropriation, is 288,000 acre-feet per annum. P. 488.

(*e*) The Wyoming appropriations senior to the proposed Colorado appropriation require 272,500 acre-feet, and the overplus available for that appropriation is therefore restricted to 15,500 acre-feet, per annum. P. 496.

11. Permits, issued by the State Engineer of Wyoming, to appropriate water in specified quantity from the stream, are mere licenses, and not adjudications that a surplus subject to appropriation exists. P. 488.

419. Argument for Wyoming.

12. The proposed Colorado appropriation is to be dated from the time when the project became a fixed plan with a definite purpose, and when work upon it was begun; not related back to an earlier date, when the project was inceptive and uncertain; and, by the same rule, several of the Wyoming appropriations are treated as relating to dates later than those claimed for them. Pp. 490–495.

THIS was an original suit, brought in this court by the State of Wyoming against the State of Colorado and two Colorado corporations, for the purpose of preventing a diversion of part of the water of the Laramie River, a stream flowing from Colorado into Wyoming. The facts are fully stated in the opinion, *post,* 455. The bill was filed on May 29, 1911. A motion to dismiss, equivalent to a demurrer, was argued and, on October 21, 1912, was overruled without prejudice. The case was argued, and twice reargued, on final hearing, the United States participating in the last two arguments, by leave of the court.

In the following summaries of the arguments made upon the last occasion, discussion of the facts is for the most part omitted.

Mr. N. E. Corthell and *Mr. John W. Lacey,* with whom *Mr. Douglas A. Preston,* Attorney General of the State of Wyoming, *Mr. John D. Clark* and *Mr. Herbert V. Lacey* were on the briefs, for complainant.

In Colorado and Wyoming, and in every other State where irrigation is practiced, it is held to be the only equitable rule that the rights of a prior appropriator shall be considered exclusive, and that he shall at all times take from the stream such amount of water as he needs up to the full amount of his appropriation, without any requirement that he divide with other appropriators in times of scarcity. He is not obliged to build reservoirs, nor store the water, but may take it from the stream as it was running when he first appropriated; he is not required to

make any expenditures whatever, in order that others may have water. Indeed, to require that he shall incur the expense necessary in storing water would often be to destroy his priority, since the expense would be more than the value of his prior right. 1 Wiel, Water Rights, 3d ed., § 279; 2 Kinney, Irrigation, 2d ed., § 801, p. 1398; *Conant* v. *Deep Creek Co.*, 23 Utah, 627; *Hill* v. *Smith*, 27 Cal. 476, 482; *Smith* v. *Denniff*, 24 Mont. 20; *Phoenix Water Co.* v. *Fletcher*, 23 Cal. 482; *Wyatt* v. *Larimer & Weld Co.*, 18 Colo. 298; *Comstock* v. *Ramsey*, 55 Colo. 244; *Barnes* v. *Sabron*, 10 Nev. 217; *Willey* v. *Decker*, 11 Wyo. 496; Rev. Stats. § 2339; *United States* v. *Rio Grande Co.*, 174 U. S. 704.

The rights of the prior appropriator are especially active in time of water deficiency. *Avery* v. *Johnson*, 59 Wash. 332; *Huning* v. *Porter*, 6 Ariz. 171; 1 Wiel, Water Rights, § 301.

In accordance with these principles, Wyoming, during the irrigation season of each year, is entitled to the flow of the stream as it may at the time naturally flow, up to the amount necessary to supply the Wyoming appropriations that are prior in time to the inception of the Colorado attempt at diversion. All of the evidence, without contradiction, shows that, in practically every year during the irrigation season, the entire stream flow is not only taken by the Wyoming prior appropriators but is necessary for the purposes of irrigating their lands; and in many of the years—dry years as they are called,—the water in the stream is insufficient for the concededly prior Wyoming appropriations. If the water were being diverted by Colorado into reservoirs within the watershed, then the objection to such diversion would be less serious. If it were diverted within the watershed, it would not be difficult, under the Wyoming system, or indeed under any system, to require the owners of the reservoir in the watershed into which the water is diverted to turn it back into

the stream for the use of the prior appropriators. But in the case at bar, Colorado's diversion will take the water to a place where it will be impossible to return it to the stream, and therefore in every year when the water in the stream may turn out to be less than the amount of the prior Wyoming appropriations plus the Colorado diversion, irreparable wrong will be done to the Wyoming appropriators, and in most of the years the wrong will go to the extent of entirely depriving many of the Wyoming appropriators of water. But in not more than one year in seven could any substantial fraction of seventy thousand acre-feet of water be taken during the irrigating season without depriving the Wyoming prior appropriators of necessary water.

We submit, therefore, that, if the state line between Colorado and Wyoming leaves the rights of appropriators as if all were in the same State, it is clear that the Wyoming appropriators have the right to the water during practically every year; that the years when they will not need it all cannot be ascertained in advance, and that the diversion as intended by Colorado, because of its character and the place to which it will take the water, will in most years cause such injury and damage as entitle the Wyoming appropriators to injunctive relief.

The question of the effect of state lines upon the rights of appropriators in different States has been before the courts of the arid region in a number of cases. The universal holding is, that priority of appropriation gives priority of right on interstate streams, the same as on streams wholly within one State. *Hoge* v. *Eaton*, 135 Fed. 411, 414 (reversed on another point, 141 Fed. 64); *Taylor* v. *Hulett*, 15 Idaho, 265; *Conant* v. *Deep Creek Co.*, 23 Utah, 627; *Willey* v. *Decker*, 11 Wyo. 496, 533; *Farm Investment Co.* v. *Carpenter*, 9 Wyo. 110; *Howell* v. *Johnson*, 89 Fed. 556; *Anderson* v. *Bassman*, 140 Fed. 14; *Morris* v. *Bean*, 123 Fed. 618; 146 Fed. 423; 159 Fed. 651,

655; *Miller* v. *Rickey*, 127 Fed. 573; 152 Fed. 11, 17; s. c. 218 U. S. 258; *Bean* v. *Morris*, 221 U. S. 485; 3 Kinney, Irrigation, § 1225.

Both Colorado and Wyoming are at the crest of the continent. They have both adopted to its broadest extent the doctrine of prior appropriation. And, whether it can stand alongside the doctrine of riparian rights in the same jurisdiction, (as it actually does in a majority of the irrigation States), or is so antagonistic as to exclude the latter, we believe that, for the purposes of the decision of this case, the doctrine of prior appropriation must furnish the rule. The people of both States, by their constitutions, have declared that doctrine to be the just and reasonable doctrine throughout the area involved in this litigation, and, by their legislatures, have reiterated the same doctrine, and provided numerous rules and regulations for carrying it out in both States. The courts in both States have given their adherence, even to the extent of saying that the rule was in force in each State long prior to any constitutions or statutes on the subject. Therefore, so far as the parties here are concerned, that rule and doctrine must be held reasonable and just, and neither State could complain of its use in settling the controversy here.

The facts in the case at bar would permit, and even justify, a decision of this cause on the general principles of prior appropriation, without deciding anything as to the rights of different States whose differing climates have caused the adoption of rules and principles differing in the one State from those in the other.

We realize that the doctrine of prior appropriation is not recognized in all the States, and that, if general principles are to be here decided, such as shall apply to all interstate streams, and boundaries shall be here fixed to the rights of differing States in interstate streams applicable to all circumstances, in reaching such universal prin-

ciples and conclusions there are many and serious problems entirely outside of mere appropriation problems.

Waters falling in Colorado flow out of that State, some to the Gulf of California, and some to the Gulf of Mexico; and it would be entirely possible within that State to construct diverting systems which would turn waters, naturally tributary to the flow into the Gulf of Mexico, into the streams emptying into the Gulf of California. The States through which the waters would run, in case of such diversion, would be different from those through which they would run naturally. The same situation exists in Wyoming, even to a greater degree. It would be entirely possible in Wyoming to construct diversion works such as would turn large bodies of the water from one great river system into another. Each State receiving water from Wyoming has great need for the water. In the case of at least two of the systems, the water from Wyoming flows into and through States which refuse to recognize rights by prior appropriation as superior to riparian rights. In some cases the needed flow from Wyoming is into States which fully recognize the doctrine of prior appropriation. We recognize that Wyoming, if allowed to divert the waters from one stream and one system to another, could inflict vast injury upon sister States. It may not be amiss, therefore, for this court to consider in the decision of this case, the general question of the effect of its decision on the problems which would naturally grow out of the attempt upon the part of Wyoming or Colorado to use within their own boundaries methods of diverting water such as will become injurious to sister States.

The streams rising in Colorado and Wyoming but illustrate the very general character of the questions involved, if rules are sought applicable universally to rights on interstate streams. The stream in the case at bar rises in Colorado, and flows into and through Wyoming, and thence into Nebraska, and on down into other States where

the riparian-rights doctrine pure and simple is adopted. The rights of Wyoming might easily be ground between the upper and nether millstone, if Colorado should be permitted to take a large share of the water on some general principle of prior appropriation, while at the same time Nebraska and lower States could require Wyoming to permit the waters to flow on down into the lower States, practically undiminished in quantity.

The situation for Wyoming will be still worse—far worse—if Colorado shall be permitted to ignore the Wyoming rights acquired by prior appropriation, and, also at the same time all riparian rights, by taking waters for use not only within the watershed, but also without, while leaving Nebraska and lower States the power to compel Wyoming to yield to Nebraska riparian rights.

[Counsel then referred to decisions of the court in *Georgia* v. *Tennessee Copper Co.*, 206 U. S. 230; *Kansas* v. *Colorado*, 206 U. S. 46; *Rickey Land Co.* v. *Miller & Lux*, 218 U. S. 258; *Bean* v. *Morris*, 221 U. S. 485; also to 3 Kinney, Irrigation, §§ 1225, 1227, 1230; to the opinion of Attorney General Harmon, 21 Ops. Atty. Gen. 274, and a letter of Mr. Evarts, 1 Moore, Int. Law Dig., 653, concerning the rights of this country and of Mexico to the waters of the Rio Grande, and to the case of *United States* v. *Rio Grande Co.*, 174 U. S. 690, and the Treaty with Mexico of May 21, 1906, 34 Stat. 2953.]

It is apparent that nothing in any of these quotations or discussions draws in any clear way the lines bounding the rights of a State, as distinguished from those of its citizens, in the waters of an interstate stream. Nor is there anything in any clear way marking out the principles upon which equitable division of waters shall be made in such streams. These matters are left to be determined by rules that may be worked out, or by analogies from rules governing such matters where the adjoining proprietors, instead of being States, are individuals. Some of the

suggestions of this court seem to hint that such rules "may be more or less analogous to common-law rights between upper and lower proprietors." (218 U. S. 258.)

A just criticism has often been made on precedents established in interstate relations, to the effect that many such precedents are almost solely the result of *vis major*. It is to be hoped that the tendencies in dealings between States are in the direction of principles of right and justice; in other words, equitable principles. When such principles are sought and applied in international relations, they are found to approximate more and more closely the equitable principles governing relations between individuals.

The parties to this controversy are not permitted to make war upon, nor even to make treaties with, one another. Their controversy is, therefore, brought to this court to be here determined. If the case is to be ruled by principles of law already discovered, so far as we can see they are ruled by principles governing between private persons. The precedents as to international rights on international streams are scarcely sufficient upon which to base any rule, and, such as they are, they are contradictory; even this Government contending, now that riparian rights govern when diversions of water were made within the boundaries of a foreign government, and again contending that the foreign government has no right to complain when diversions were made within the boundaries of this country, and still later, while in words protesting that it was not doing so, in deeds recognizing the rights of those injured by diversions within our territories.

The Roman law, as appears from the Pandects of Justinian, adopted the principles of riparian rights, and apparently allowed something in the way of irrigation and of equitable division of waters for that purpose. The same is true of the Code Napoleon, Art. 644, and of the

Mexican law at the time of the acquisition of our Mexican territory, including Colorado and large parts of Wyoming. 1 Wiel, Water Rights, pp. 68, 685, 1026. But in all these jurisdictions, while water was to an extent used for irrigation, riparian rights were held superior to rights for irrigation.

It is needless to cite authority to show that in Great Britain, and in most of the States of the Union, while there has been some limited right to use water for irrigation, still the rights of the riparian proprietor are superior. In all the jurisdictions above mentioned, the riparian proprietor had the right to insist that the use of water should not unreasonably reduce the flow of the stream, should be confined within the watershed, and the surplus be returned to the stream.

There are eighteen of our own States and Territories which may be denominated generally the irrigation States, inasmuch as in each there is more or less of arid land requiring irrigation, and the laws recognize, more or less, irrigation rights. In ten of these, while the use of waters of streams for irrigation is permitted, the riparian proprietor is recognized as having the superior right, and the waters are not permitted to be diverted by the irrigators beyond the watershed; but the surplus must be returned to the original stream. 1 Wiel, Water Rights, p. 849; 1 Kinney, Irrigation, p. 782; 2 Farnham, Waters, p. 1572; 3 *id.*, p. 1903; *Wiggins* v. *Water Co.*, 113 Cal. 182; *Bathgate* v. *Irvine*, 125 Cal. 135; *Southern California Co.* v. *Wilshire*, 144 Cal. 68; *Anaheim Water Co.* v. *Fuller*, 150 Cal. 327; *Clark* v. *Allaman*, 71 Kans. 206; *Watkins Land Co.* v. *Clements*, 98 Tex. Civ. App. 578; *Matagorda Co.* v. *Markham Co.*, 154 S. W. 1176.

In the other seven irrigating States, viz., Arizona, Colorado, Idaho, New Mexico, Nevada, Utah, and Wyoming, fuller rights of appropriation are recognized, and apparently the right is recognized to take water outside the

watershed, even over the objections of those within it. But in none of these States is any diversion from the watershed permitted on any principle of equitable division, even remotely expressed or implied. On the contrary, each of these States insists upon the doctrine that the rights of a prior appropriator are exclusive, even to the full extent of his prior appropriation. No division of the waters which would take anything from the prior appropriator to his injury is recognized as in any sense equitable.

This court, in *Kansas* v. *Colorado,* reached a conclusion that, on the facts in that case, equitable division of the waters was a reasonable principle, as between adjoining States on an interstate stream. As we understand that case, this principle of equitable division was not evolved as a new principle, but was a mere application of the doctrine of equitable division as between private riparian owners. No rules for equitable division were there laid down, nor were any such rules even discussed, excepting by a reference to rules of division between riparian owners.

The equitable division was all within the watershed. No question arose there of permitting such division as would carry waters without the watershed. One would search in vain for any doctrine of equitable division of waters which would permit one proprietor to carry the waters without the watershed, with no obligation to return them to the stream, in any State or country administering the rule of riparian rights. In the seven States, possibly the most arid, as we have seen, no doctrine of equitable division of the waters is allowed.

It is interesting, moreover, to note that there are at least tendencies in some of these States, constituting the seven last above mentioned, to recognize rights of owners along the stream and to restrict the diversion beyond the watershed. Nevada Laws, 1907, c. 18, § 4, p. 31; New Mexico

Laws, 1907, c. 49, § 72, p. 95; *Hutchison* v. *Watson Ditch Co.*, 16 Idaho, 484; *Anderson* v. *Bassman*, 140 Fed. 14.

This court has in many cases considered the rights of States as against one another. *Missouri* v. *Illinois*, 180 U. S. 208; *Georgia* v. *Tennessee Copper Co.*, 206 U. S. 230; *Kansas* v. *Colorado*, 185 U. S. 125; 206 U. S. 46, and cases cited by these. It is clearly established by this court that a State does not have a right to do acts within her own borders which shall affirmatively cause injury in another State. The question of the sovereign right of Colorado to take the waters as she will, is one so fully settled by this court that, even if the principle claimed by Colorado were much better founded, in reason, we should not feel it necessary to discuss it further.

Mr. Victor E. Keyes, Attorney General of the State of Colorado, *Mr. Delph E. Carpenter* and *Mr. Platt Rogers*, with whom *Mr. Leslie E. Hubbard*, *Mr. Fred Farrar*, *Mr. Julius C. Gunter* and *Mr. Ralph E. C. Kerwin* were on the briefs, for defendants.[1]

The rights of the States here involved necessarily include the rights and claims of their respective citizens. *Kansas* v. *Colorado*, 206 U. S. 46, 85. It is as though the controversy were between independent Nations. *Missouri* v. *Illinois*, 180 U. S. 208; 200 U. S. 496; *Kansas* v. *Colorado*, 185 U. S. 125; 206 U. S. 46; *Rickey Land Co.* v. *Miller & Lux*, 218 U. S. 258; *Georgia* v. *Tennessee Copper Co.*, 206 U. S. 230, 237, 238. Nations have absolute dominion of everything within their boundaries, including the waters, and the property rights of the individual are

[1] The case was argued on behalf of the defendants, at the hearing in 1916, by *Messrs. Farrar* (then Attorney General of Colorado), *Carpenter* and *Gunter;* and at the hearing in 1918, by *Messrs. Hubbard* (then Attorney General of Colorado), *Farrar*, *Carpenter* and *Rogers*.

such only as the State may grant him. Vattel, Law of Nations (Chitty ed., 1872) pp. 53, 120, 123, 125, 148, 149, 163, 164; *The Exchange*, 7 Cr. 116, 136; *Rhode Island* v. *Massachusetts*, 12 Pet. 657, 733, 734.

Each State of the Union, new or original, has the same unlimited jurisdiction over persons and things within its territorial limits as any Nation, where that jurisdiction has not been surrendered to the United States by the Constitution. *New York* v. *Miln*, 11 Pet. 102, 139; *Chisholm* v. *Georgia*, 2 Dall. 419, 435; *Texas* v. *White*, 7 Wall. 700, 725; Taylor, Int. Law, § 124; Whart. Dig. Int. Law, § 1; *Pennoyer* v. *Neff*, 95 U. S. 722; *Kansas* v. *Colorado*, 206 U. S. 46, 93.

Each of the new States is possessed of the same powers and jurisdiction over the streams within its borders as were retained by the original States, and the sovereign powers exercised by Congress over the Territories passed to the new States upon their admission, including jurisdiction of streams within their borders, with the right to determine the use that may be made of their waters by individuals, except as Congress may control navigation. The uses recognized as limited property rights in the citizen have been determined by each State according to its own necessities, and fixed by its local laws and decisions; and the United States and its courts have adopted the state laws, regulations and court decisions, as the rules controlling within their respective jurisdictions. Congress, whenever it has legislated upon the subject with respect to public lands, has specifically recognized these local laws, customs and court decisions as controlling the regulation of streams within the States.

From the earliest decisions of this court to the present time, all uses of water for navigation, fisheries, power, domestic, irrigation, and other beneficial purposes, have been treated as within the sovereign jurisdiction and con-

trol of the several States, save alone for the federal control of navigation.[1]

Acts of Congress and decisions of the courts and the Land Department, declare the jurisdiction of the public land States over the waters within their domain, in so far as the United States is concerned.[2]

S. 274; *Jennison* v. *Kirk*, 98 U. S. 453, 456; *United States* v. *Rio Grande Co.*, 174 U. S. 690;

The Colorado enabling act and the proclamation of the President, admit the State to the Union "on an equal footing with the original States in all respects whatsoever." 18 Stat. 474; 19 Stat. 665. The constitution, made in pursuance of the enabling act, and approved by the proclamation, declares that the water of every natural stream, not already appropriated, is the property of the public and dedicated to use of the people of the State, subject to appropriation as provided. It thus appears that, on her very admission, and as a part of the solemn transaction, Colorado asserted her full sovereign dominion over the waters of her streams, and that this assertion was then and there approved by the United States. These provisions of her constitution have been many times upheld by her courts;[1] and her claim to full jurisdiction over the waters within her borders has been repeatedly asserted by her legislature. (Citing many acts.) Wyoming has assumed the same attitude.[2] She, likewise, refuses to permit the diversion of waters in Wyoming for use in other jurisdictions.

The two States, therefore, are at one, in asserting full and exclusive sovereign control; in permitting usufructuary rights to their citizens according to the appropriation doctrine; and in denying these privileges to other States and their citizens.

Gutierres v. *Albuquerque Land Co.*, 188 U. S. 545; *Kansas* v. *Colorado*, 206 U. S. 46; *Boquillas Cattle Co.* v. *Curtis*, 213 U. S. 339; *Twin Falls Canal Co.* v. *Foote*, 192 Fed. 583; *Stanfield* v. *Umatilla River Water Users Assn.*, 192 Fed. 596; *Withdrawal of Public Lands for Irrigation Purposes*, 32 L. D. 254.

[1] See *Wheeler* v. *Northern Colorado Irrig. Co.*, 10 Colo. 582; *Ft. Morgan Co.* v. *South Platte Co.*, 18 Colo. 1; *Stockman* v. *Leddy*, 55 Colo. 24.

[2] Wyo. Const., Art. VIII, §§ 1–5; Wyo. Comp. Stats. 1910, § 724, p. 247; *Farm Investment Co.* v. *Carpenter*, 9 Wyo. 110; (distinguishing *Willey* v. *Decker*, 11 Wyo. 496); *Grover Irrig. Co.* v. *Lovella Ditch Co.*, 21 Wyo. 204.

It might be said that the United States, in admitting these States with their constitutions as they are, gave recognition to their claims amounting to a grant. *Farm Investment Co.* v. *Carpenter*, 9 Wyo. 110. But their jurisdictions and rights are not so dependent, but rest directly on the Federal Constitution. *Stockman* v. *Leddy*, 55 Colo. 24; *Kansas* v. *Colorado*, 206 U. S. 46; *United States* v. *Hanson*, 167 Fed. 881.

The doctrines of riparian rights and of appropriation are local rules for determining the private rights of citizens in particular States—usufructuary rights in the property of the State, which, in the final analysis, must yield to the will of the State and her eminent domain.[1]

They have no extra-territorial force, either for or against the State. Story, Conflict of Laws, c. 2, pp. 19–34; *Pennoyer* v. *Neff*, 95 U. S. 714, 720. The State has an interest, independent of and behind the title of its citizens. *Georgia* v. *Tennessee Copper Co.*, 206 U. S. 230; *Kansas* v. *Colorado*, 206 U. S. 46, 99; *Hudson Water Co.* v. *McCarter*, 209 U. S. 349, 354–357.

That private rights in waters of interstate streams cannot determine the rights of States *inter sese*, is recognized in *Rickey Land Co.* v. *Miller & Lux*, 218 U. S. 258, 260, 261; and *Bean* v. *Morris*, 221 U. S. 485. The assumption of concurrence or acquiescence made in those cases, whereby rights might be acquired in one State for enjoyment or use in another, cannot be applied in the case of Colorado. And the question of constitutional protection, passed in *Bean* v. *Morris*, *supra*, 488, cannot arise here, since, with the exception of one small appropriation, no

[1](*a*) Riparian rights. 3 Kent Com., § 439; 2 Black. Com., pp. 14, 18; *McCarter* v. *Hudson Water Co.*, 70 N. J. Eq. 525; 70 N. J. Eq. 695; s. c. 209 U. S. 349, 355; *St. Anthony Falls Co.* v. *Water Commissioners*, 168 U. S. 349; *Whitaker* v. *McBride*, 197 U. S. 510, 511.

(*b*) Rights by appropriation. *United States* v. *Rio Grande Co.*, 174 U. S. 690, 702; *Kansas* v. *Colorado*, 206 U. S. 46, 94.

use whatever had been made of the waters of the Laramie River prior to the admission of Colorado, in 1876; and substantially all of the Wyoming development has occurred since that date, and a large part subsequent to the Colorado project here complained of.

Even were we to assume that Colorado had not, since 1876, expressly denied recognition of all extra-territorial claims, the fact remains that there is no concurrence of laws upon which to base a presumption of interstate servitudes. Both States assert full ownership and control over the waters within their borders and abolish the system of riparian rights. Beyond this the systems diverge.

The doctrines of riparian rights and of appropriation both are fundamentally inapplicable to the regulation of rights between States, which stand upon an equality "in all respects whatever," to the same degree as independent Nations. Each State depends for its existence primarily upon its natural resources, of which water, in the arid regions, is frequently the most valuable. Self defense compels the State to withhold its resources for the benefit of future as well as present generations and for the welfare and perpetuity of the State. With independent Nations, these natural resources, if need require, must be defended by the sword. But with States of the Union this court must determine the controversy. *Kansas* v. *Colorado*, 185 U. S. 125; 206 U. S. 46; *Missouri* v. *Illinois*, 180 U. S. 208; 200 U. S. 496.

If the rule of riparian rights were to control the settlement of this controversy, Colorado would be forever deprived of all but the most insignificant use of her own waters in the Laramie, and her fertile but arid lands would remain forever unproductive, by reason of the fact that only the lands of the narrow mountain valleys in Colorado are riparian; and these waters, imperative to her present and future development and welfare, would

pass forever into Wyoming, there to be used, enjoyed or wasted, or pass to the sea. On the other hand, by the doctrine of appropriation, if physical conditions had permitted, all waters of this stream, those rising in Wyoming included, might have been diverted within the latter State, and carried into and applied to land in Colorado; and, if all this were prior to Wyoming developments, Colorado could forever after prevent Wyoming from the use, not only of the Colorado waters, but of those rising in Wyoming as well.

Canals and diversion works are usually first constructed where no natural obstacles interfere. Infant Nations or States can little afford to undertake projects which, in their later history, their accumulated energies often accomplish with apparent ease. Prior appropriation is very frequently the accident of physical location; and, were the rule to apply between States, their destiny would be determined, not by their present or future necessities for use of their natural resources, but rather by accident. While, to be sure, the rule does apply to individuals within the State, in their case the preference of the first taker is within the governmental powers of the State; and, in disposing of its resources to the most ultimate good, inasmuch as the water, if parceled among the many, would benefit no one, the State may determine to whom the exclusive use may be given, in order ultimately to bring to the State and its people the greatest benefit with the least waste; and, furthermore, the State, whenever it may so desire, by the power of eminent domain, may take away all vested usufructuary rights and establish some new plan adapted to future conditions, only perhaps in the future to again condemn and establish still a different order of things.

But we can not agree that among Nations or States, with equal powers and sovereign rights, one may claim through its citizens, by mere first use, a preferred and

exclusive right perpetually to use for its benefit waters rising within and flowing from the domain of its neighbor, thereby to deny forever to the Nation or State of origin a part or all of the benefit of its own stream, be its necessities ever so great. Waters that rise and flow from one State into another are forever lost to the former unless there used, and any rule which forbids this use denies to that State the benefit of its inherent sovereign right to enjoy its own and maintain itself within its domain. It would be, in effect, to invade and take the domain of one State and to give it to another, without consent or compensation. It would be the assertion by a foreign State of jurisdiction over a portion of the domain of another State.

The usufructuary rights of the individual citizen of Wyoming are defined by the constitution, laws and decisions of the courts of that State. But the local law of Wyoming can have no extra-territorial effect, and especially when prejudicial to the rights of other States. Story, Conflict of Laws, § 32, p. 29; *Farnum* v. *Blackstone Canal Co.*, 1 Sumner, 46, 62; *The Exchange*, 7 Cr. 116, 136; Cooley, Const. Lim., 7th ed., p. 176; *Hilton* v. *Guyot*, 159 U. S. 113. One State cannot expropriate property within the territory of another State. I Whart. Int. Law Digest, pp. 38, 39; *Crosby* v. *Hanover*, 36 N. H. 404, 423; *Holyoke Water Co.* v. *Connecticut River Co.*, 52 Conn. 570, 575, 576; *McCarter* v. *Hudson Water Co.*, 70 N. J. Eq. 695, 717.

The fundamental rule that one Nation cannot exercise its sovereign power and jurisdiction over the waters or domain of another Nation without its consent and cannot expropriate the waters of an upper Nation for the use of the lower Nation by claim of prior appropriation, even on an international river, has been recognized and followed by the United States in its relations with Mexico. 21 Ops. Atty. Gen. 280–283. When the United States, as a

matter of international policy but not of international law, settled the differences over the Rio Grande with Mexico, it took the precaution so to word the treaty that the adjustment could never be taken as a recognition of any lawful claims by Mexico. Treaty of May 1, 1906, Art. V, 34 Stat. 2953.

As we understand the term "equal," when used with reference to the States, it refers to that equality in the family of States which obtains with Nations in the family of Nations. Each State has an equal right, not only to govern itself, but as well to maintain itself and improve its domain, increase in population and promote for the present and for all time the general welfare of itself and its citizens. But if, (purely by way of illustration) we were to use a narrower construction, and say that equal States have the right to enjoy an equal part of an interstate stream, even then the doctrine of appropriation is inapplicable, for it takes from one State an exclusive (not equal) portion of the waters of the stream, and gives it to the other without remuneration.

Priority is a rule of the past and not of the future. States must look to the future more than to the past. *Hudson Water Co.* v. *McCarter*, 209 U. S. 349, 355. The State may find its future needs so imperative that it must extinguish, by eminent domain, even the usufructuary property rights it has permitted its citizens, and take the waters for a greater need. How, then, could the limited right of a State, determined upon rules of priority of appropriation, as regards another State, be reconciled with its future imperative necessities?

How solve the problem, if one State has adopted the law of appropriation and the other the modified doctrine of riparian rights? What would be the result, if the principle of appropriation were applied as between two appropriation States and, thereafter, one should change and adopt the common-law doctrine of riparian rights? De-

termination of the rights of the various appropriators in the two States upon the basis of priority would be thrown into complete confusion. Neither State can legislate for or impose its own policy upon the other; Congress cannot enforce either rule upon any State.

The unnecessary loss, occasioned by depriving the State of origin of control of its waters, and by causing the water to pass down losing streams in order to supply some prior appropriator in another State, would appear to be wasteful, and inept, and so inequitable and unjust.

Could any advocate of the doctrine of appropriation regardless of state lines advance any hypothesis upon which a stream and its tributaries, like the Colorado River, flowing within or bordering six States and a foreign country, could be administered, and the water apportioned to the various appropriators in the seventeen hundred or more miles of its length, upon the basis of priority of appropriation?

If priority of right regardless of state lines is the principle which governs this controversy, how are the rights of the respective individuals in Wyoming and Colorado to be determined, having due regard to the conflicting laws of each State; and, after determination, how are they to be enforced? Possibly this court might appoint an officer or direct a United States marshal to organize a body of men to police the stream and divide the water according to the priorities which this court might undertake to adjudicate; but the very suggestion shows the absurdity of the contention. No such procedure was ever in contemplation either by Congress or by the respective States where water is used for irrigation. The entire adjudication and administration of priorities is founded, and has been constructed, on the theory of state control, and is utterly in conflict with any other theory. Manifestly, the doctrine of priority of appropriation does not adapt itself to interstate questions. Diversion and uses of water under the rule of priority require the most rigid police regulation.

The state courts, understanding as they do the local conditions and necessities, are in the best position to adjust conflicts between individual appropriators. But, if priorities must obtain irrespective of state lines, local courts will be shorn of their jurisdiction and some other court or tribunal will of necessity assume the task. The difficulties are greatly enlarged when appropriations by reservoirs and the complicated system of exchanging water are taken into the account. Taking the Platte River and its branches, for illustration, it may be estimated that administration under the rule of priority, irrespective of state lines, would require readjudication and police regulation of upwards of 4,000 diversions already established and decreed by state authorities in Colorado, Wyoming and Nebraska, and, in the years to come, probably a like number of new and now more or less incomplete enterprises. In view of the fact that the right of each appropriator is limited to his actual necessities each day, and that his diversions must constantly be regulated and restricted accordingly; and in view of the complications arising from exchanges and other administrative features existing upon each of the tributaries, as well as upon the stream itself; it is self-evident that the difficulties confronting interstate administration of the Platte River would become so involved that, to give each appropriator his just dues, and no more, and at the particular time his necessities demanded, would be next to impossible. If such should be declared to be the rule, the rights of all must be protected and enforced, the least must receive the same consideration as the greatest, and that, too, at the particular time when the crop demands water in order that loss may be avoided.

Yet state officials and tribunals are confined in power to their own borders, and bound by local laws, rules and regulations. They can not adjust conflicting claims or determine rights of foreign users. Different systems in

different States invite irreconcilable conflict and insoluble administrative problems.

If this court should decide that the private usufructuary rights of the individual appropriators preclude the States from asserting greater rights to the river, and that priority shall obtain irrespective of state lines, then such rights must be adjudicated by the court in this and similar cases. This would necessitate a determination not of the rights of the States, but of each individual claimant; and the rights of each, great or small, would have to be separately considered and passed upon. The mere suggestion of the problem portrays the insurmountable obstacles to be encountered.

Then, too, conditions are constantly changing. New and conflicting rules and laws may become imperative in Colorado, Nebraska and Wyoming. Who then shall enact these laws? The subject is no longer within the control of the States, because their jurisdiction has been denied them. Congress cannot legislate, for it has no power so to do. 206 U. S. 90–92. The canals divert waters from streams washing lands long since passed into private hands, and not public lands of the United States. This court cannot legislate. Who then shall remedy the evil or supply the new rule?

It would seem, from the opinion in *Kansas* v. *Colorado*, 206 U. S. 46, that any doctrine of equitable apportionment of the waters of rivers between States must be founded upon a broad basis of equitable consideration of all the facts of each case as they appear, with full regard to the equal rights of States of equal dignity, powers and jurisdiction, and not upon the narrower basis of local laws governing mere usufructuary rights of private citizens. But even though we here construe that decision within the narrower limits and assume an equal apportionment of the waters of the stream, we here find that the Laramie River rises not in one but in both States. The waters of

the Wyoming part of the stream, as well as those of the Colorado branch, are available to Wyoming and her citizens. On the other hand, natural conditions are such that Colorado is limited to use of but a part (91/250) of the waters of that branch which rises and flows within her borders. Whatever the injury might be to Wyoming (though none has been proved), this would not appear to be an inequitable use of her own resources by Colorado.

A greater degree of caution is manifest in such controversies as this, than would obtain in suits between citizens within the same or different jurisdictions. The complaining State should be required to establish the injury and its right to relief upon the clearest and most indisputable testimony, before this court would be warranted in preventing the other State from exercising its sovereign control over its natural resources. *Missouri* v. *Illinois*, 180 U. S. 208, 248.

Wyoming has wholly failed to prove the allegations of her bill, and even more, has by her own conduct denied her charges against Colorado by permitting appropriations for and authorizing construction of many new and enormous enterprises in Wyoming, long junior to the Colorado enterprise of which she complains and drawing water from the same stream; and, irrespective of other conclusive proof, has thereby admitted that there was and is ample water in the stream to supply all appropriations junior, as well as senior, to the Colorado enterprise, and that no injury could result to senior appropriations in Wyoming by reason of the Colorado diversion; and that by her official acts, she has contributed to the very depletion whereof she complains. Further, the proof shows that, not only is there ample water in the stream for use of all Wyoming enterprises, but, as well, that Wyoming needlessly wastes more water than will be withdrawn from the stream by Colorado. And, furthermore, the proof reveals, without contradiction, that Wyoming is not only

diverting from the drainage of the Cache la Poudre over into that of the Laramie, but generally recognizes and permits such diversions, by official sanction and decrees of her courts, within her own territory, and by means thereof she has been able tc effect her most valuable reclamation and development. No proof was offered in support of her claims as a riparian owner and, on the other hand, by her constitution, laws and decisions of her courts, she has abolished and denied any such; and, lastly, she has offered no sufficient proof whereby this court could adjudicate and determine the relative rights of appropriation within either Wyoming or Colorado, if such a rule as she alleges were here applied.

Mr. Assistant Attorney General Riter, with whom *Mr. Solicitor General Beck* and *Mr. John F. Truesdell,* Special Assistant to the Attorney General, were on the brief, for the United States.[1]

The attitude of the executive branch of the Government is, briefly, that the United States has not surrendered to the States or parted in any way with its original right to use the surplus waters (those not appropriated by others under its own laws) of innavigable streams in the Western States; that the United States is, and always has been, since the cession of the territories now comprised in those States, the owner of all the unappropriated and surplus waters; that the appropriated waters there have been granted by the United States under its own laws, using local customs and state laws as subordinate instrumentalities only; that the rights of the States, both as the actual owners of lands granted to them and as the ultimate owners of the property of their citizens, so far as

[1] *Mr. Solicitor General Davis* argued the case on behalf of the United States, at the hearing in 1918. *Mr. Assistant Attorney General Kearful, Mr. Truesdell,* and *Mr. Ethelbert Ward,* Special Assistant to the Attorney General, were with him on the brief.

they may be said to be such owners, are confined to such water rights as have been granted by the United States to them or their citizens under the laws of Congress; and that controversies such as this should be decided upon the basis of such federal grants, and without regard to state boundaries.

As for the effect of these questions upon the public interests and governmental policies of the United States, we think it sufficient here to call attention to the vast areas of land still belonging to the United States; to the fact that much of it is in the arid region where land without water to irrigate it, is of little value; to the federal reclamation policy, which depends upon federal use of both land and water and often upon federal use of interstate streams; to the federal Indian policy, where the Government's ability to protect its Indian wards depends largely upon its ownership and control of the waters on reservations and other Indian lands; and, finally, to the fact that, if the water on these public lands be held to belong to the States, the Federal Government will be at the mercy of the States and be helpless as to these policies in a very real sense, because, while under our system the States are represented in and have a powerful influence upon the Federal Government, the United States is not in any way represented in the States, and, both theoretically and as a practical matter can not control or even influence their action.

The United States retains its original plenary ownership of the right of use of innavigable waters in the Western States, except in so far as it has parted with it through acts of Congress; and this property, like the property in the public lands generally, is wholly immune from state interference or control. The state power affects only those rights which have been granted by Congress.

We respectfully suggest the necessity of keeping separately in mind the two questions of, first, whether the

United States or the States own the right of use of the innavigable waters in the Western States, and, second, the effect of a decision of that question upon the rights of these two opposing States in the waters of an interstate stream. It is our contention that federal ownership controls, and offers a logical and workable solution of this question of rights between the States; but, even if we should be wrong in this, we deem it clear that the United States owns the right of use of the waters in and on its public lands within the States, just as it owns the lands themselves, and that such ownership should not be thrown in doubt by any decision as to the broader question of the rights between States.

Upon the acquisition of the territory now comprised within the Western States, the United States became vested with all property rights in that territory except vested private rights and such Indian rights as the United States might choose to recognize. Therefore, whatever property rights exist in water in that territory, whether the water be navigable or innavigable, belonged to the United States until the creation of the States; and, furthermore, such rights are still federal property, notwithstanding the creation of the States unless, first, they are of such a character as to go to the States upon their mere creation as such and because of the character of state sovereignty, or unless, second, they have been granted to the States or to private persons under acts of Congress.

Property rights in navigable waters and their shores and beds become vested in the States on their creation, as a part of their sovereignty, but the rule is different as to nonnavigable waters and their places of occurrence. The States take no property rights in them. Such waters are not *publici juris*, and title to their use is the same as title to land.

Because of its fugitive nature, the only property rights which exist in water in its natural state are rights of use,

the corpus being only susceptible of ownershi; while in possession. This corpus while in possession i: personal property, but the right of use of the water in) natural state is a real property right of the highest c:. ıity and value. *Tyler* v. *Wilkinson*, 4 Mason, 397; *F* ıbrey v. *Owen*, 6 Ex. 352; 20 L. J. Ex. 212; *Hargrave* v. .ok, 108 Cal. 72; *Smith* v. *Rochester*, 92 N. Y. 463, 480 *Gardner* v. *Newburgh*, 2 Johns. Ch. 162, 166; *Insuran* ? *Co.* v. *Childs*, 25 Colo. 360, 363; *Davis* v. *Randall*, 14 Colo. 488, 492. 3 Kent. Com. p. 439; Wiel, Wate Rights, 3d ed., p. 755; § 711, p. 777 *et seq.*, and nume ıus cases cited; § 283, p. 298; § 285, p. 301; Long, Irri ıtion, 2d ed., § 34, p. 70; 2 Kinney, Irrigation, 2d ed., § 76! p. 1328; Washburn, Easements, 4th ed., pp. 316, 317; 2 V ashburn, Real Property, 6th ed., § 1284.

Because of the necessity of protecting the p· lic interests therein (mainly navigation and fishery) property rights in navigable waters in England belon· d *prima facie* to the Crown; and in this country they be. ng *prima facie* to the municipal sovereignties, the St· es. The Federal Government, though having full cont l (under the commerce clause) for purposes of foreign nd interstate navigation, has no right of property in s· h waters, or their shores or beds, except as it derives i· rom the States, either by grant or under operation of tate law. *Shively* v. *Bowlby*, 152 U. S. 1, 15, 46, 48; *Hardin* v. *Jordan*, 140 U. S. 371, 381; *United States* v. *Chandler-Dunbar Co.*, 229 U. S. 53, 63; *United States* v. *Rio Grande Co.*, 174 U. S. 690.

The crux of the question we are examining is whether innavigable waters are *publici juris*, like navigable waters. Ownership by the States depends upon showing that they are. Such waters are not *publici juris* and ownership of usufructuary rights therein rests upon the same basis and is of the same character as ownership of land. In the first place, it is to be noted that it is now decided beyond any

further possibility of question that the beds and shores of innavigable streams and lakes, even though they are meandered, are owned as ordinary upland is owned, and are not owned by the States. Title to such lands in the public land States comes from the United States and not from the States. *Hardin* v. *Shedd,* 190 U. S. 508. The fact that this court holds that the grantee of the upland from the United States takes to the thread of the stream or not in accordance with the state law, using such law as a rule of convenience merely, in no way weakens this statement. The title comes from the United States, and it is perfectly competent for Congress to change this rule of convenience applied to the grants of the United States if it sees fit. [Cf. *Oklahoma* v. *Texas,* 258 U. S. 574; *Brewer-Elliott Oil Co.* v. *United States,* 260 U. S. 77. Reporter.]

As to the property rights in these innavigable waters themselves, it is to be observed, first, that diffused surface waters and all underground waters were originally looked upon by the law as part and parcel of the soil, and as belonging to its owner. The tendency now is to recognize these waters as distinct from the soil, and as being susceptible of ownership, when out of possession, only as to usufructuary rights therein. Furthermore, the tendency is to treat such rights, not only as interlocking with the rights in the streams and lakes which the underground waters support, but also (even, we think, in the pure appropriation States) as belonging to the several owners of the lands which have access to them. Wiel, Water Rights, §§ 1090, 1124.

Turning to the innavigable surface streams and lakes, it will be found that, in England, it was recognized, at least as early as Lord Hale's time, that the proprietary right in the use and flow of such waters was not in the Crown. Unlike navigable waters, they did not at common law belong *prima facie,* or of common right, to the

sovereign, but did so belong to private persons just as land did. The rule was, and is, the same in our original States; and so, following the same principle upon which this court decided that navigable waters and their shores and beds go to the new States, as well as to the original ones, since it is the States which under our system are the possessors of municipal sovereignty (*Pollard* v. *Hagan*, 3 How. 212, 229, and *Shively* v. *Bowlby*, 152 U. S. 1), we see that neither the new States, nor the original thirteen, have any property rights in innavigable waters by virtue of their sovereignty, or have any different kind of power whatever over them than they have over land. *Smith* v. *Rochester*, 92 N. Y. 463, 473; *Gardner* v. *Newburgh*, 2 Johns Ch. 162, 166; Lord Hale's de Jure Maris, with Judge Cowan's note to *Ex parte Jennings*, 6 Cow. 536, 539-546; *Watuppa Reservoir Co.* v. *Fall River*, 147 Mass. 548, 554, 555, 558, 561; *Home of Aged Women* v. *Commonwealth*, 202 Mass. 422, 433-434; *Opinions of Justices*, 118 Me. 503, 506, 507; *Wadsworth* v. *Smith*, 11 Me. 278, 280, 281; *Chapman* v. *Kimball*, 9 Conn. 38, 40, 41; *Barclay R. R. Co.* v. *Ingham*, 36 Pa. St. 194, 200, *et seq;* Angell, Water Courses, 6th ed., pars. 2, 535; Gould, Waters, 3d ed., par. 46; *Cobb* v. *Davenport*, 32 N. J. L. 369; *Simmons* v. *Paterson*, 60 N. J. Eq. 385, 389; *Attorney General* v. *Delaware &c. R. R. Co.*, 27 N. J. Eq. 631, 638; *Doremus* v. *Paterson*, 65 N. J. Eq. 711, 712. Contra, in part: *McCarter* v. *Hudson Water Co.*, 70 N. J. Eq. 695, affirmed by this court on other and broader grounds. 209 U. S. 349.

General expressions by some of the early writers, and also the existence of prescriptive rights, for a time left some doubt as to whether water, as such, was not *publici juris*, and also as to whether the riparian owner's right to divert the waters on which his land bordered was not dependent in some way upon actual appropriation. Whatever doubt existed in that respect was put at rest in England by a series of cases of which *Mason* v. *Hill*, 5

Barn. & Adol. 1, 23, 24, decided by Lord Denman in 1833, was perhaps the most important. In this country the question had already been disposed of by Mr. Justice Story in *Tyler* v. *Wilkinson,* 4 Mason, 397. Since those cases, it has been settled that, under the common law, both in England and in the United States, the usufructuary rights to innavigable waters belong to the owners of the land bordering on them; that the rights of such owners in the water are in no way dependent upon its use; that such waters are in no proper sense *publici juris,* as, for instance, navigable waters are; that the water right is part and parcel of the title to land itself; and that title to such usufructuary right has the same origin as the title to the land. *Embrey* v. *Owen,* 6 Ex. 352, 368; 20 L. J. Ex. 212; *Ferguson* v. *Shirreff,* 6 Dunlop, 1355, 1374 (Scot's Rev. Reps.)

Undoubtedly the States have the power to control individuals in their use of water. Whatever the power is, it is limited by the provisions of the Fourteenth Amendment protecting vested rights. The power is the same as that which the State has over vested rights in lands. Water rights, under both the appropriation and the riparian doctrines, are vested rights in real property, which can be lost only by grant, condemnation, prescription, or abandonment. The ways in which this power of the State is exercised, of course, will differ in accordance with the kind of property the use of which is to be affected or controlled. Thus, we have regulations limiting the use of land for the public good that would not be at all applicable to water, and, vice versa, we have regulations concerning water that could not apply to land. Wiel, Water Rights, pp. 196, 197; *Robertson* v. *People,* 40 Colo. 119, 124; *Broad Run Co.* v. *Duel Co.,* 47 Colo. 573, 579; *Combs* v. *Farmers Co.,* 38 Colo. 420, 428.

The argument based on the necessities of the arid region wrongly assumes that the riparian system is not suited to

western conditions and that, therefore, the States can dispose of the federal property in water. We think it sufficient here to point out that the main principle of the riparian system is equality of right between the riparian owners; that they among them own the entire right of use of the stream; that any proper use under the circumstances, including, of course, irrigation, is permitted; that rights exactly like appropriation rights can be and frequently are created by grant or condemnation of rights of the riparian owners; that the appropriation system, so called, is not so much a system of owning and using rights as it is a means of acquiring them; that it is an open question whether the correlative rights of the riparian system are not better suited to an irrigation community than the sometimes more definite and less related appropriation rights; and finally, that both classes of rights are now being created out of, and logically rest, under our theory, upon the original federal ownership of riparian rights, and that the argument for state ownership is merely one that it would be better to allow the States to dispose of this class of federal property, and is as applicable to lands as to water.

The fundamental principle of water law, that the corpus of water can only be the subject of ownership while in possession, and that, therefore, water itself in its natural state is owned by no one, has no effect upon the question of whether the title to the usufructuary right therein belongs to the State as a part of its sovereignty.

Water rights now vested in others derive their existence, like titles to land, from the acts of Congress. All interest in water not so granted necessarily remains in the United States. The acts grant nothing to the States, and ratification of state constitutions asserting state ownership of water does not divest the United States of its property rights therein. The earliest acts of Congress affecting innavigable waters show full consciousness of power to deal with

such waters on the public lands. Rev. Stats. § 2476. Acts of May 18, 1796, 1 Stat. 468; March 3, 1803, § 17, 2 Stat. 235; February 20, 1811, § 3, 2 Stat. 642; and March 3, 1811, § 12, 2 Stat. 666; *Railroad Co.* v. *Schurmeir*, 7 Wall. 272, 289; *Scott* v. *Lattig*, 227 U. S. 229, 242; *Hardin* v. *Shedd*, 190 U. S. 508, 519. Since the passage of the Act of July 26, 1866, 14 Stat. 251, the disposition of such waters on the public lands has been controlled by that act and by the local laws and customs used as its subordinate instrumentalities. The occasion of this legislation was the extensive occupation and exploitation of the public lands in the West following the discovery of gold in California. The need was to legalize appropriations of mineral land, rights of way, and water rights already made under local customs and laws, and to provide for the future acquisition of rights of the same character in the same manner. *Jennison* v. *Kirk*, 98 U. S. 453; *Atchison* v. *Peterson*, 20 Wall. 507; *Basey* v. *Gallagher*, 20 Wall. 670; *Broder* v. *Water Co.*, 101 U. S. 274; Wiel, Water Rights, § 66, *et seq.*; § 92, *et seq.*; 1 Kinney, Irrigation, §§ 596, 611, 636, *et seq.* To meet this situation the Act of 1866 and the supplementary Act of 1870, 16 Stat. 217, were passed. Congress had already provided adequate means for the acquisition of the government title to agricultural lands by passing the Homestead Act in 1862.

The relation of the Acts of 1866 and 1870 to water rights and waterways was precisely the same as their relation to the mineral lands. Their mining features were crude and were superseded by the more detailed Act of May 10, 1872, 17 Stat. 91, in which, however, the policy of favoring local laws and granting mining rights in accordance therewith is adhered to. The water features of the original acts are still in force. That the Act of 1866 provides a means for the future acquisition of rights, water as well as mining, is the settled holding of the

courts, and made perfectly clear by the Act of 1870. *Jacob* v. *Lorenz*, 98 Cal. 332, 335; *Beaver Brook* v. *St. Vrain*, 6 Colo. App. 130, 138; Wiel, Water Rights, § 99, p. 116; Long, Irrigation, § 74, p. 134.

This legislation is the foundation of all water rights in the Western States today and provides a solution and, we think, the only solution, of the problem of interstate streams. Mineral lands are held open to "exploration and occupation", and he who occupies is given the right to take the other steps which lead to a grant. Water rights are protected and preserved to whoever has possessed them. Local laws, rules, and customs are used in both cases to define the right and provide the course that must be followed to acquire it. The mineralized vein is recognized, as it was before by the customs of the miners, as being the thing appropriated, and so the right is given to follow it regardless of the surface limits of the claim extending vertically downward, which ordinarily define the extent of land holdings. In the field of water rights, again in accordance with local customs, the one who first "appropriates," even for use on nonriparian lands, is given the better right. Both as to mining and water, however, the rights granted are only such as any proprietor of the whole property involved could grant, and the rule of priority is only that which necessarily follows from successive conveyances of defined parts of a whole.

Further, it should be observed that, under this act, the proprietor, the United States, in a way holds its landed estate for conveyance in three classes—mineral rights, water rights, and what may be called, for convenience, ordinary land rights. It holds all of these rights for conveyance separately or together, as the case may be. Consequently, and generally speaking, riparian rights pass or not, under a patent of riparian land, according to whether or not the riparian doctrine or the appropriation doctrine is the rule in the locality where the land is situ-

ated. Congress has provided that it shall be otherwise in the Black Hills Forest Reserve in South Dakota (34 Stat. 233, 234).

It is well understood that the local rules, whether found in miners' customs, court decisions, or legislative acts, were adopted merely to supplement the particular provisions and fundamental conditions of the act, in order to fit it to local conditions, including local preferences, and avoid unnecessary complexity and volume in the act itself. This plan of adopting local laws or rules as the laws and rules of Congress is familiar enough. It is seen in the legislation defining crimes on reservations under exclusive jurisdiction of the General Government; in the conformity provisions governing the federal courts in common-law cases; in various laws for the taking of affidavits, etc. Illustrations might be greatly multiplied. Lindley on Mines, 2d ed., § 249; *Butte City Water Co.* v. *Baker*, 196 U. S. 125; *Clason* v. *Matko*, 223 U. S. 646, 654.

It is somewhat astonishing to find *Broder* v. *Water Co.*, 101 U. S. 274, and *Jennison* v. *Kirk*, 98 U. S. 453, 456, cited in Colorado's brief as authority for the idea that the Act of 1866 recognized an independent title or power in the States. They hold exactly the reverse. See *Union Co.* v. *Ferris*, 2 Sawy. 176, 184; 1 Wiel, Water Rights, § 97, p. 113; § 155, p. 177 *et seq.;* Long, Irrigation, § 74, p. 134. The grant is made directly to the individual appropriator. It takes effect upon his bringing himself within its terms by complying with the local laws. No patent follows as in the case of mining claims, but the title passes by virtue of the statute itself and compliance with it, as is the case with grants of rights of way. Yale, Mining and Water Rights, p. 380.

The law of water rights in California and the numerous States which have followed her lead is based squarely upon the federal title. 1 Wiel, Water Rights, p. 226; *Lux* v. *Haggin*, 69 Cal. 255, 338; *Benton* v. *Johncox*, 17

Wash. 277, 289; *Morgan* v. *Shaw*, 47 Ore. 333, 337; *Smith* v. *Denniff*, 24 Mont. 20, 21; *Barkley* v. *Tieleke*, 2 Mont. 59, 64; *Cruse* v. *McCauley*, 96 Fed. 369, 373–374; *Howell* v. *Johnson*, 89 Fed. 556, 558. Colorado and the other pure appropriation States (1 Wiel, Water Rights, p. 226), endeavor to find some basis for water rights other than the federal title. In those States water rights are identical with appropriation rights in California and the other dual system States, and, of course, are derived, as they are there, from the United States by grants under this act. Subsequent acts of Congress contradict the theory that federal ownership has been abdicated. Kinney, Irrigation, § 637, and pp. 1091, 1095; *Hough* v. *Porter*, 51 Ore. 318; *Gutierres* v. *Albuquerque Land Co.*, 188 U. S. 545, 552–554; Acts of March 3, 1877, 19 Stat. 377; August 18, 1894, 28 Stat. 422; June 4, 1897, 30 Stat. 11, 36; February 26, 1897, 29 Stat. 599; March 2, 1897, 29 Stat. 603; June 17, 1902, 32 Stat. 388.

The legislation of Congress, with regard to water rights, all centers upon, and is intended to preserve, the policy adopted in the Act of 1866. It is the long continuance of subordinate state control, under a system that involves no recourse to the source of power, that has caused the fact that such control is subordinate sometimes to be lost sight of.

Ratification of state constitutions asserting state ownership of waters does not divest the United States of its property rights therein. Colo. Const., Art. XVI, § 6; *Coyle* v. *Oklahoma*, 221 U. S. 559, 568; *Ex parte Webb*, 225 U. S. 663, 690; *Wilcox* v. *McConnell*, 13 Pet. 498, 516; Kinney, Irrigation, § 388, p. 660.

The question whether the United States or the States own the water of innavigable streams in the West has never been directly passed upon by this court. The cases support federal ownership. Wiel, Water Rights, pp. 183, 194, 223; Kinney, Irrigation, § 640; Long, Irrigation, § 74,

p. 134; *Atchison* v. *Peterson*, 20 Wall. 507; *Basey* v. *Gallagher*, 20 Wall. 670; *Sturr* v. *Beck*, 133 U. S. 541; *United States* v. *Rio Grande Co.*, 174 U. S. 690, 704; *Gutierres* v. *Albuquerque Land Co.*, 188 U. S. 545; *Kansas* v. *Colorado*, 206 U. S. 46; *Winters* v. *United States*, 207 U. S. 564; *Boquillas Land Co.* v. *Curtis*, 213 U. S. 339.

Upholding of state ownership would disintegrate the law and destroy federal interests without working any practical good to the States.

This controversy, as one involving an interstate stream, should be decided upon the basis of the federal ownership of lands and waters, thereby confining the ownership of the States, as ultimate proprietors, to such water rights as have been or may be granted to the respective States for themselves or for use in connection with the lands within their borders. In practice the Federal Government disregards state lines in the use and control of waters for its own purposes; and state lines have been equally disregarded in the grant, and acquisition, and use, of private water rights in the Western States; so a division of water between the States, making state lines controlling, would interfere with the federal use of water and seriously modify, or destroy, existing vested rights. These rights, being grants from the paramount sovereignty, should be upheld as against the claim that the States, which enjoy a quasi sovereignty only, should be treated in this respect as independent Nations.

Mr. Justice Van Devanter delivered the opinion of the court.

This is an original suit in this court by the State of Wyoming against the State of Colorado and two Colorado corporations to prevent a proposed diversion in Colorado of part of the waters of the Laramie River, an interstate stream. The bill was brought in 1911, the evidence was

taken in 1913 and 1914, and the parties put it in condensed and narrative form in 1916 preparatory to the usual printing. The case has been argued at the bar three times. The court directed one reargument because of the novelty and importance of some of the questions involved, and the other because of an intervening succession in the office of Chief Justice. As the United States appeared to have a possible interest in some of the questions, the court also directed that the suit be called to the attention of the Attorney General; and, by the court's leave, a representative of the United States participated in the subsequent hearings.

The Laramie is an innavigable river which has its source in the mountains of northern Colorado, flows northerly 27 miles in that State, crosses into Wyoming, and there flows northerly and northeasterly 150 miles to the North Platte River, of which it is a tributary. Both Colorado and Wyoming are in the arid region where flowing waters are, and long have been, commonly diverted from their natural channels and used in irrigating the soil and making it productive. For many years some of the waters of the Laramie River have been subjected to such diversion and use, part in Colorado and part in Wyoming.

When this suit was brought the two corporate defendants, acting under the authority and permission of Colorado, were proceeding to divert in that State a considerable portion of the waters of the river and to conduct the same into another watershed, lying wholly in Colorado, for use in irrigating lands more than fifty miles distant from the point of diversion. The topography and natural drainage are such that none of the water can return to the stream or ever reach Wyoming.

By the bill Wyoming seeks to prevent this diversion on two grounds: One that, without her sanction, the waters of this interstate stream cannot rightfully be taken from

its watershed and carried into another where she never can receive any benefit from them; and the other that through many appropriations made at great cost, which are prior in time and superior in right to the proposed Colorado diversion, Wyoming and her citizens have become and are entitled to use a large portion of the waters of the river in the irrigation of lands in that State and that the proposed Colorado diversion will not leave in the stream sufficient water to satisfy these prior and superior appropriations, and so will work irreparable prejudice to Wyoming and her citizens.

By the answers Colorado and her co-defendants seek to justify and sustain the proposed diversion on three distinct grounds: First, that it is the right of Colorado as a State to dispose, as she may choose, of any part or all of the waters flowing in the portion of the river within her borders, "regardless of the prejudice that it may work" to Wyoming and her citizens; secondly, that Colorado is entitled to an equitable division of the waters of the river and that the proposed diversion, together with all subsisting appropriations in Colorado, does not exceed her share; and, thirdly, that after the proposed diversion there will be left in the river and its tributaries in Wyoming sufficient water to satisfy all appropriations in that State whose origin was prior in time to the effective inception of the right under which the proposed Colorado diversion is about to be made.

Before taking up the opposing contentions a survey of several matters in the light of which they should be approached and considered is in order.

Both Colorado and Wyoming are along the apex of the Continental Divide and include high mountain ranges where heavy snows fall in winter and melt in late spring and early summer,—this being the chief source of water supply. Small streams in the mountains gather the water from the melting snow and conduct it to larger streams

below which ultimately pass into surrounding States. The flow in all streams varies greatly in the course of the year, being highest in May, June and July and relatively very low in other months. There is also a pronounced variation from year to year. To illustrate, the gaging of the Cache la Poudre, a typical stream, for 1912 shows that the total flow for May, June and July was more than three times that for the nine other months, and the gaging for a period of 30 years shows that the yearly flow varied from 151,636 to 666,466 acre-feet [1] and was in excess of 400,000 acre-feet in each of four years and less than 175,000 acre-feet in each of five years. Both States have vast plains and many valleys of varying elevation where there is not sufficient natural precipitation to moisten the soil and make it productive, but where, when additional water is applied artificially, the soil becomes fruitful,—the reward being generous in some areas and moderate in others, just as husbandry is variously rewarded in States where there is greater humidity, such as Massachusetts, Virginia, Ohio and Tennessee. Both States were Territories long before they were admitted into the Union as States and while the territorial condition continued were under the full dominion of the United States. At first the United States owned all the lands in both and it still owns and is offering for disposal millions of acres in each.

Turning to the decisions of the courts of last resort in the two States, we learn that the same doctrine respecting the diversion and use of the waters of natural streams has prevailed in both from the beginning and that each State attributes much of her development and prosperity to the practical operation of this doctrine. The relevant views of the origin and nature of the doctrine, as shown in these decisions, may be summarized as follows: The

[1] An acre-foot is the quantity of water required to cover an acre to a depth of one foot—43,560 cubic feet.

common-law rule respecting riparian rights in flowing water never obtained in either State. It always was deemed inapplicable to their situation and climatic conditions. The earliest settlers gave effect to a different rule whereby the waters of the streams were regarded as open to appropriation for irrigation, mining and other beneficial purposes. The diversion from the stream and the application of the water to a beneficial purpose constituted an appropriation, and the appropriator was treated as acquiring a continuing right to divert and use the water to the extent of his appropriation, but not beyond what was reasonably required and actually used. This was deemed a property right and dealt with and respected accordingly. As between different appropriations from the same stream, the one first in time was deemed superior in right, and a completed appropriation was regarded as effective from the time the purpose to make it was definitely formed and actual work thereon was begun, provided the work was carried to completion with reasonable diligence. This doctrine of appropriation, prompted by necessity and formulated by custom, received early legislative recognition in both Territories and was enforced in their courts. When the States were admitted into the Union it received further sanction in their constitutions and statutes and their courts have been uniformly enforcing it. *Yunker* v. *Nichols,* 1 Colo. 551; *Schilling* v. *Rominger,* 4 Colo. 100; *Coffin* v. *Left Hand Ditch Co.,* 6 Colo. 443; *Thomas* v. *Guiraud,* 6 Colo. 530; *Strickler* v. *Colorado Springs,* 16 Colo. 61; *Oppenlander* v. *Left Hand Ditch Co.,* 18 Colo. 142; *Wyatt* v. *Larimer, & Weld Irrigation Co.,* 18 Colo. 298; *Crippen* v. *White,* 28 Colo. 298; *Moyer* v. *Preston,* 6 Wyo. 308; *Farm Investment Co.* v. *Carpenter,* 9 Wyo. 110; *Willey* v. *Decker,* 11 Wyo. 496; *Johnston* v. *Little Horse Creek Irrigating Co.,* 13 Wyo. 208.

As the United States possessed plenary authority over Colorado and Wyoming while they were Territories and

has at all times owned the public lands therein, we turn next to its action.

The Act of July 26, 1866, c. 262, § 9, 14 Stat. 251, contained a section providing: "Whenever, by priority of possession, rights to the use of water for mining agricultural, manufacturing, or other purposes, have vested and accrued, and the same are recognized and acknowledged by the local customs, laws, and the decisions of courts, the possessors and owners of such vested rights shall be maintained and protected in the same." The occasion for this provision and its purpose and effect were extensively considered by this court in the cases of *Atchison* v. *Peterson*, 20 Wall. 507, and *Basey* v. *Gallagher* 20 Wall. 670, the conclusions in both being shown in the following excerpt from the latter, pp. 681–682:

"In the late case of *Atchison* v. *Peterson*, we had occasion to consider the respective rights of miners to running waters on the mineral lands of the public domain; and we there held that by the custom which had obtained among miners in the Pacific States and Territories, the party who first subjected the water to use, or took the necessary steps for that purpose, was regarded, except as against the government, as the source of title . . . all controversies respecting it; that the doctrines of the common law declaratory of the rights of riparian proprietors were inapplicable, or applicable only to a limited extent, to the necessities of miners, and were inadequate to their protection; that the equality of right recognized by that law among all the proprietors upon the same stream, would have been incompatible with any extended diversion of the water by one proprietor, and its conveyance for mining purposes to points from which it could not be restored to the stream; that the government by its silent acquiescence had assented to and encouraged the occupation of the public lands for mining; and that he who first connected his labor with property thus situated

and open to general exploration, did in natural justice acquire a better right to its use and enjoyment than others who had not given such labor; that the miners on the public lands throughout the Pacific States and Territories, by their customs, usages, and regulations, had recognized the inherent justice of this principle, and the principle itself was at an early period recognized by legislation and enforced by the courts in those States and Territories, and was finally approved by the legislation of Congress in 1866. The views there expressed and the rulings made are equally applicable to the use of water on the public lands for purposes of irrigation. No distinction is made in those States and Territories by the custom of miners or settlers, or by the courts, in the rights of the first appropriator from the use made of the water, if the use be a beneficial one."

And on the same subject it was further said, in *Broder* v. *Water Co.*, 101 U. S. 274, 276:

"It is the established doctrine of this court that rights of miners, who had taken possession of mines and worked and developed them, and the rights of persons who had constructed canals and ditches to be used in mining operations and for purposes of agricultural irrigation, in the region where such artificial use of the water was an absolute necessity, are rights which the government had, by its conduct, recognized and encouraged and was bound to protect, before the passage of the act of 1866. We are of opinion that the section of the act which we have quoted was rather a voluntary *recognition of a pre-existing right of possession*, constituting a valid claim to its continued use, than the establishment of a new one."

The Act of July 9, 1870, c. 235, § 17, 16 Stat. 217, provided that "all patents granted, or preemption or homesteads allowed, shall be subject to any vested and accrued water rights" acquired under or recognized by the provision of 1866. These provisions are now §§ 2339 and 2340 of the Revised Statutes.

The Act of March 3, 1877, c. 107, § 1, 19 Stat. 377, providing for the sale of desert lands in tracts of one section each to persons undertaking and effecting their reclamation, contained a proviso declaring that "the right to the use of water by the person so conducting the same, on or to any tract of desert land of six hundred and forty acres shall depend upon *bona fide* prior appropriation: and such right shall not exceed the amount of water actually appropriated, and necessarily used for the purpose of irrigation and reclamation: and all surplus water over and above such actual appropriation and use, together with the water of all lakes, rivers and other sources of water supply upon the public lands and not navigable, shall remain and be held free for the appropriation and use of the public for irrigation, mining and manufacturing purposes subject to existing rights." Colorado was not at first included in this act, but was brought in by an amendatory act. Next came the Act of March 3, 1891, c. 561, § 18, 26 Stat. 1095, granting rights of way through the public lands and reservations for canals and ditches to be used for irrigation purposes, and containing a proviso saying, "the privilege herein granted shall not be construed to interfere with the control of water for irrigation and other purposes under authority of the respective States or Territories."

Of the legislation thus far recited it was said, in *United States* v. *Rio Grande Dam & Irrigation Co.*, 174 U. S. 690, 706: "Obviously by these acts, so far as they extended, Congress recognized and assented to the appropriation of water in contravention of the common law rule as to continuous flow"; and again, "the obvious purpose of Congress was to give its assent, so far as the public lands were concerned, to any system, although in contravention to the common law rule, which permitted the appropriation of those waters for legitimate industries."

June 17, 1902, c. 1093, 32 Stat. 388, the National Reclamation Act was passed, under which the United States entered upon the construction of extensive irrigation works to be used in the reclamation of large bodies of arid public lands in the western States. Its eighth section declared: "Nothing in this act shall be construed as affecting or intended to affect or to in any way interfere with the laws of any State or Territory relating to the control, appropriation, use, or distribution of water used in irrigation, or any vested right acquired thereunder, and the Secretary of the Interior, in carrying out the provisions of this Act, shall proceed in conformity with such laws, *and nothing herein shall in any way affect any right of any State or of the Federal Government or of any landowner, appropriator, or user of water in, to, or from any interstate stream or the waters thereof: Provided,* That the right to the use of water acquired under the provisions of this Act shall be appurtenant to the land irrigated, and beneficial use shall be the basis, the measure, and the limit of the right." The words which we have italicized constitute the only instance, so far as we are advised, in which the legislation of Congress relating to the appropriation of water in the arid land region has contained any distinct mention of interstate streams. The explanation of this exceptional mention is to be found in the pendency in this court at that time of the case of *Kansas* v. *Colorado,* wherein the relative rights of the two States, the United States, certain Kansas riparians and certain Colorado appropriators and users in and to the waters of the Arkansas River, an interstate stream, were thought to be involved. Congress was solicitous that all questions respecting interstate streams thought to be involved in that litigation should be left to judicial determination unaffected by the act,—in other words, that the matter be left just as it was before. The words aptly reflect that purpose.

The decision in *Kansas* v. *Colorado*, 206 U. S. 46, was a pioneer in its field. On some of the questions presented it was intended to be and is comprehensive, and on others it was intended to be within narrower limits, the court saying, "the views expressed in this opinion are to be confined to a case in which the facts and the local law of the two States are as here disclosed." On full consideration it was broadly determined that a controversy between two States over the diversion and use of waters of a stream passing from one to the other "makes a matter for investigation and determination by this court" in the exercise of its original jurisdiction, and also that the upper State on such a stream does not have such ownership or control of the waters flowing therein as entitles her to divert and use them regardless of any injury or prejudice to the rights of the lower State in the stream. And, on consideration of the particular facts disclosed and the local law of the two States, it was determined that Colorado was not taking more than what under the circumstances would be her share under an equitable apportionment.

As respects the scope and interpretation of the ultimate conclusion in that case it should be observed, first, that the court was there concerned, as it said, with a controversy between two States, "one recognizing generally the common-law rule of riparian rights" and the other the doctrine of appropriation; secondly, that the diversion complained of was not to a watershed from which none of the water could find its way into the complaining State, but quite to the contrary; and, thirdly, that what the complaining State was seeking was not to prevent a proposed diversion for the benefit of lands as yet unreclaimed, but to interfere with a diversion which had been practiced for years and under which many thousands of acres of unoccupied and barren lands had been reclaimed and made productive. In these circumstances, and after observing that the diminution in the flow of

the river had resulted in " perceptible injury " to portions of the valley in Kansas, but in " little, if any, detriment " to the great body of the valley, the court said, " it would seem equality of right and equity between the two States forbids any interference with the present withdrawal of water in Colorado for purposes of irrigation; " and that, if the depletion of the waters by Colorado should be increased, the time would come when Kansas might " rightfully call for relief against the action of Colorado, its corporations and citizens in appropriating the waters of the Arkansas for irrigation purposes." What was there said about " equality of right " refers, as the opinion shows (p. 97), not to an equal division of the water, but to the equal level or plane on which all the States stand, in point of power and right, under our constitutional system.

Like that case the one now before us presents a controversy over the waters of an interstate stream. But here the controversy is between States in both of which the doctrine of appropriation has prevailed from the time of the first settlements, always has been applied in the same way, and has been recognized and sanctioned by the United States, the owner of the public lands. Here the complaining State is not seeking to impose a policy of her choosing on the other State, but to have the common policy which each enforces within her limits applied in determining their relative rights in the interstate stream. Nor is the United States seeking to impose a policy of its choosing on either State. All that it has done has been to recognize and give its sanction to the policy which each has adopted. Whether its public land holdings would enable it to go further we need not consider. And here the complaining State is not seeking to interfere with a diversion which has long been practiced and under which much reclamation has been effected, but to prevent a proposed diversion for the benefit of lands as yet unreclaimed.

With this understanding of the case in hand and of some of the matters in the light of which it should be con-

sidered, we take up the several contentions, before noticed, which are pressed on our attention.

The contention of Colorado that she as a State rightfully may divert and use, as she may choose, the waters flowing within her boundaries in this interstate stream, regardless of any prejudice that this may work to others having rights in the stream below her boundary, can not be maintained. The river throughout its course in both States is but a single stream wherein each State has an interest which should be respected by the other. A like contention was set up by Colorado in her answer in *Kansas* v. *Colorado* and was adjudged untenable. Further consideration satisfies us that the ruling was right. It has support in other cases, of which *Rickey Land & Cattle Co.* v. *Miller & Lux*, 218 U. S. 258; *Bean* v. *Morris*, 221 U. S. 485; *Missouri* v. *Illinois*, 180 U. S. 208, and 200 U. S. 496, and *Georgia* v. *Tennessee Copper Co.*, 206 U. S. 230, are examples.

The objection of Wyoming to the proposed diversion on the ground that it is to another watershed, from which she can receive no benefit, is also untenable. The fact that the diversion is to such a watershed has a bearing in another connection, but does not in itself constitute a ground for condemning it. In neither State does the right of appropriation depend on the place of use being within the same watershed. Diversions from one watershed to another are commonly made in both States and the practice is recognized by the decisions of their courts. *Coffin* v. *Left Hand Ditch Co.*, 6 Colo. 443, 449; *Thomas* v. *Guiraud*, 6 Colo. 530; *Hammond* v. *Rose*, 11 Colo. 524; *Oppenlander* v. *Left Hand Ditch Co.*, 18 Colo. 142, 144; *Moyer* v. *Preston*, 6 Wyo. 308, 321; *Willey* v. *Decker*, 11 Wyo. 496, 529–531. And the evidence shows that diversions are made and recognized in both States which in principle are not distinguishable from this, that is, where water is taken in one State from a watershed leading into

the other State and conducted into a different watershed leading away from that State, and from which she never can receive any benefit. The principle of such diversions being recognized in both States, its application to this interstate stream does not in itself afford a ground for complaint, unless the practice in both be rejected in determining what, as between them, is reasonable and admissible as to this stream, which we think should not be done.

We are thus brought to the question of the basis on which the relative rights of these States in the waters of this interstate stream should be determined. Should the doctrine of appropriation, which each recognizes and enforces within her borders, be applied? Or is there another basis which is more consonant with right and equity?

The lands in both States are naturally arid and the need for irrigation is the same in one as in the other. The lands were settled under the same public land laws and their settlement was induced largely by the prevailing right to divert and use water for irrigation, without which the lands were of little value. Many of the lands were acquired under the Desert Land Act which made reclamation by irrigation a condition to the acquisition. The first settlers located along the streams where water could be diverted and applied at small cost. Others with more means followed and reclaimed lands farther away. Then companies with large capital constructed extensive canals and occasional tunnels whereby water was carried to lands remote from the stream and supplied, for hire, to settlers who were not prepared to engage in such large undertakings. Ultimately, the demand for water being in excess of the dependable flow of the streams during the irrigation season, reservoirs were constructed wherein water was impounded when not needed and released when needed, thereby measurably equalizing the natural flow. Such was the course of irrigation development in both

States. It began in territorial days, continued without change after statehood, and was the basis for the large respect always shown for water rights. These constituted the foundation of all rural home building and agricultural development, and, if they were rejected now, the lands would return to their naturally arid condition, the efforts of the settlers and the expenditures of others would go for naught and values mounting into large figures would be lost.

In neither State was the right to appropriate water from this interstate stream denied. On the contrary, it was permitted and recognized in both. The rule was the same on both sides of the line. Some of the appropriations were made as much as fifty years ago and many as much as twenty-five. In the circumstances we have stated, why should not appropriations from this stream be respected, as between the two States, according to their several priorities, as would be done if the stream lay wholly within either State? By what principle of right or equity may either State proceed in disregard of prior appropriations in the other?

Colorado answers that this is not a suit between private appropriators. This is true, but it does not follow that their situation and what has been accomplished by them for their respective States can be ignored. As respects Wyoming the welfare, prosperity and happiness of the people of the larger part of the Laramie valley, as also a large portion of the taxable resources of two counties, are dependent on the appropriations in that State. Thus the interests of the State are indissolubly linked with the rights of the appropriators. To the extent of the appropriation and use of the water in Colorado a like situation exists there.

Colorado further answers that she can accomplish more with the water than Wyoming does or can; that she proposes to use it on lands in the Cache la Poudre valley, and

that they with less water will produce more than the lands in the portion of the Laramie valley known as the Laramie Plains. It is true that irrigation in the Poudre valley has been carried to a higher state of development than elsewhere in the Rocky Mountain region and that the lands of that valley lie at a lower altitude than do those in the Laramie Plains and generally are better adapted to agriculture. In some parts they also require less water. It may be assumed that the lands intended to be reclaimed and irrigated in the Poudre valley conform to the general standard, although this is left uncertain. But for combined farming and stockraising those of the Laramie Plains offer opportunities and advantages which are well recognized. It is to this use that they chiefly are devoted. It is a recognized and profitable industry, has been carried on there for many years and is of general economic value. Many of the original ranchmen still are engaged in it,—some on the tracts where they first settled. With the aid of irrigation, native hay of a high quality, alfalfa, oats and other forage are grown for winter feeding, the live stock being grazed most of the year on unirrigated areas and in the neighboring hills and mountains. In this way not only are the irrigated tracts made productive, but the utility and value of the grazing areas are greatly enhanced. The same industry is carried on in the same way in sections of Colorado. In both States this is a purpose for which the right to appropriate water may be exercised, and no discrimination is made between it and other farming. Even in this suit Colorado is asserting appropriations of this class for 4,250 acres in the portion of the Laramie valley in that State, and is claiming under them an amount of water in excess of what she asserts will irrigate a like acreage in the Poudre valley.

Some of the appropriations from the stream in Wyoming are used for agriculture alone. One of the large projects, dating from territorial days, and constructed at

great cost, carries water from the river through a tunnel one-half mile long and canals several miles in length to the Wheatland District where it is used in irrigating 30,000 acres, all of which are very successfully and profitably farmed in small tracts. This project uses one very large and one comparatively small reservoir for storing water and equalizing the natural flow.

We conclude that Colorado's objections to the doctrine of appropriation as a basis of decision are not well taken, and that it furnishes the only basis which is consonant with the principles of right and equity applicable to such a controversy as this is. The cardinal rule of the doctrine is that priority of appropriation gives superiority of right. Each of these States applies and enforces this rule in her own territory, and it is the one to which intending appropriators naturally would turn for guidance. The principle on which it proceeds is not less applicable to interstate streams and controversies than to others. Both States pronounce the rule just and reasonable as applied to the natural conditions in that region; and to prevent any departure from it the people of both incorporated it into their constitutions. It originated in the customs and usages of the people before either State came into existence, and the courts of both hold that their constitutional provisions are to be taken as recognizing the prior usage rather than as creating a new rule. These considerations persuade us that its application to such a controversy as is here presented cannot be other than eminently just and equitable to all concerned.

In suits between appropriators from the same stream, but in different States recognizing the doctrine of appropriation, the question whether rights under such appropriations should be judged by the rule of priority has been considered by several courts, state and federal, and has been uniformly answered in the affirmative. *Conant* v. *Deep Creek Irrigation Co.*, 23 Utah, 627, 631; *Willey* v.

Decker, 11 Wyo. 496, 534–535; *Taylor* v. *Hulett*, 15 Idaho, 265, 271; *Howell* v. *Johnson*, 89 Fed. 556; *Hoge* v. *Eaton*, 135 Fed. 411; *Morris* v. *Bean*, 146 Fed. 423; *Bean* v. *Morris*, 159 Fed. 651. One of the cases came to this court and the judgment below was affirmed. *Bean* v. *Morris*, 221 U. S. 485. These decisions, although given in suits between individuals, tend strongly to support our conclusion, for they show that by common usage, as also by judicial pronouncement, the rule of priority is regarded in such States as having the same application to a stream flowing from one of them to another that it has to streams wholly within one of them.

The remaining questions are largely matters of fact. The evidence is voluminous, some of it highly technical and some quite conflicting. It has all been considered. The reasonable limits of an opinion do not admit of its extended discussion. We must be content to give our conclusions on the main questions and make such references to and comment on what is evidential as will point to the grounds on which the conclusions on those questions rest. As to minor questions we can only state the ultimate facts as we find them from the evidence.

The question first in order, and the one most difficult of solution, relates to the flow of the Laramie River, the common source of supply. The difficulty arises chiefly out of the fact that the flow varies greatly in the course of the year and also from year to year.

Colorado's evidence, which for convenience we take up first, is directed to showing the average yearly flow of all years in a considerable period, as if that constituted a proper measure of the available supply. We think it is not a proper measure,—and this because of the great variation in the flow. To be available in a practical sense the supply must be fairly continuous and dependable. No doubt the natural flow can be materially conserved and equalized by means of storage reservoirs, but this has

its limitations, both financial and physical. The construction of reservoirs of real capacity is attended with great expense, and unless an adequate return reasonably can be foreseen the expenditure is not justified and will not be made. The years of high water and those of low do not alternate. Often several of the same kind follow in succession. The evaporation of stored water in Colorado and Wyoming is from five to six feet per year. So, while it generally is practicable to store water in one part of the year for use in another, or in one year for use in the next, it often, if not generally, is impracticable to store it for longer periods. All this is recognized elsewhere in Colorado's evidence. One of her principal witnesses said:

"With regard to financial practicability of construction of reservoirs on Poudre River capable of conserving extraordinary floods, will state that they call for an expenditure that could be utilized only occasionally. It would be similar to financial proposition of people in Florida preparing to heat their houses in the same manner as those in the northern part of the United States. For years of unusually high flow in the Poudre River, conservation works, to utilize the excess waters in that stream, would have to count on carrying water over more than one year. The utilization of this water means the presence of population on the land; that population must have a living from year to year and they are not justified in going out on the land and settling to raise a crop only once in three or four years. They must have sufficient to make a living from one year to another, and consequently the investment must be such that there can be sufficient water every year to keep these people on the land, and when water can only be conserved once in every three to five years, there must be provision for carrying over water or the people cannot live. It is a question of population as well as investment. The population has to exist and stay on the ground. From standpoint of investment, con-

servation of flow such as extreme flow of 1884 would be impractical to the extent that it exceeded the ordinary high year. Of such character would be [also] the floods of 1885, 1900 and 1909, three [four] years in thirty." The same witness further said: "Aside from reasons which I have given why reservoirs designed to catch only these rare high water flows of Poudre River are not feasible, it is a fact that no farmer would be able to anticipate the high flow and therefore could not depend at all upon water for irrigation until it reached him. If he undertook to so divert water it would become a gamble rather than a safe guide for living."

Another of her witnesses said:

"The present storage capacity in the Poudre Valley is such that in some years the reservoirs are not all filled, while in some years they are filled and water runs to waste. . . . It would not be possible to inaugurate a scheme in the Poudre Valley to construct reservoirs to store water from one year of high flow to another where such water is the only source of supply, for the reservoirs would have to be constructed to hold the maximum amount, and if the water has to be carried over for three years the average diversion from the reservoir would be only one-third of its capacity, making the cost per acre prohibitive."

And still another of her witnesses, referring to the unused waters of the Poudre in years of high flow and also to what is contemplated by the defendants in respect of the Laramie, said:

"The really dependable water supply of the District [1] will come from the Laramie River, the amount secured from the Poudre River fluctuating greatly and being used to augument the supply from the Laramie. There will

[1] The reference is to the Greeley-Poudre Irrigation District, one of the defendants.

be years when the supply from the Poudre Riv · and its tributaries will be practically nothing. Our plan. contemplate taking all the water that it is possible for · to take from the Laramie River each year. It is possi e to get only a certain amount from that river, and I · not believe that we can absolutely depend on ore th half the required amount from the Laramie Riv . The ry great floods on that watershed we cannot co sider be ause we cannot construct works to take care of em."

In accord with these statements, bearing o what is susceptible of use in actual practice, is furthe evidence coming from Colorado's witnesses and exhib. s to the effect that, notwithstanding the great need fo water in the Poudre valley and the returns obtained fr. its use, large amounts of water pass down the stream w hout use or impounding in the years when the flow exce s what is termed the average. With the high state of irr ation development in that valley the full capacity of th eservoir system there provided when the proof was t ken was 146,655 acre-feet,—an evidence of the limitatio inhering in the practical storage of water from such stre as.

The Cache la Poudre River heads in the same ountain range as does the Laramie and the conditions w ch make for a pronounced variation in the natural flo. are largely the same with both. The following table com led from data relating to the Cache la Poudre, furnishe by Colorado, will be helpful in illustrating the view of the witnesses, and also ours. We add the third and f rth columns.

VARIATION IN ANNUAL NET DISCHARGE
OF
CACHE LA POUDRE RIVER.
April to October, both inclusive, for 30 years.
Taken from Colorado's Exhibit 124.

Year.	Run-off in acre-feet.	Variance from average of all.	Variance from average of all but four.
1884	666,466	+369,144	+403,883
1885	465,475	+168,153	+202,892
1886	290,392	− 6,930	+ 27,809
1887	286,840	− 10,482	+ 24,257
1888	155,970	−141,352	−106,613
1889	185,060	−112,262	− 77,523
1890	221,023	− 76,299	− 41,560
1891	257,236	− 40,086	− 5,347
1892	193,790	−103,532	− 68,793
1893	216,730	− 80,592	− 45,853
1894	309,444	+ 12,122	+ 46,861
1895	344,500	+ 47,178	+ 81,917
1896	162,340	−134,982	−100,243
1897	332,070	+ 34,748	+ 69,487
1898	172,290	−125,032	− 90,293
1899	388,591	+ 91,269	+126,008
1900	474,573	+177,251	+211,990
1901	339,155	+ 41,833	+ 76,572
1902	151,636	−145,686	−110,947
1903	345,150	+ 47,828	+ 82,567
1904	315,437	+ 18,115	+ 52,854
1905	361,652	+ 64,330	+ 99,069
1906	279,974	− 17,348	+ 17,391
1907	386,224	+ 88,902	+123,641
1908	252,843	− 44,479	− 9,740
1909	486,002	+188,680	+223,419
1910	157,514	−139,808	−105,069
1911	205,611	− 91,711	− 56,972
1912	297,722	+ 400	+ 35,139
1913	217,959	− 79,363	− 44,624

Average 297,322, including all years.
Average 262,583, omitting 1884, 1885, 1900, and 1909.

This table shows that during thirty years—1884 to 1913—the yearly flow of the Cache la Poudre ranged from 151,636 to 666,466 acre-feet, that in sixteen of the thirty it fell below the average, and that eight of the sixteen

were in immediate succession. Obviously it is not financially practicable, even by means of reservoirs, to equalize the flow of a stream subject to such variation so that it will have a fairly constant and dependable flow at the average of all years. For further illustration we have taken the average of the twenty-six years remaining after excluding the four described by the witness as extraordinary (these being left to take the average of the others) and on that basis have made a computation of the excess and deficiency, which is shown in the fourth column of the table. Even on this basis there were thirteen years in which the flow was below the average and, of these, six came in immediate succession. In four the deficiency exceeded 100,000 acre-feet and of the four only one followed a year in which there was an excess sufficient, if carried over in storage, to cover the deficiency. This suffices to show that the average of all years is far from being a proper or safe measure of the available supply. An intending irrigator acquiring a water right based on such a measure would be almost certainly confronted with drought when his need for water was greatest. Crops cannot be grown on expectations of average flows which do not come, nor on recollections of unusual flows which have passed down the stream in prior years. Only when the water is actually applied does the soil respond.

We have dealt with the matter of the average flow at this length because throughout Colorado's evidence and in her briefs it is treated as if it were a proper measure of the supply available for practical use. It is there applied to the Laramie not only directly, but indirectly by increasing the gaged flow for a particular year or period by percentages derived by comparing the flow of the Poudre for that year or period with the average for the thirty years, including those in which the flow was so extraordinary that concededly much of it neither was nor could be used. Thus water which is not part of the available supply is counted in measuring that supply.

When the evidence was taken, in 1913 and 1914, the Laramie had not been gaged so thoroughly nor for so long a period as had the Cache la Poudre. Such gaging as had occurred had been done at different places in different periods, partly by the United States Geological Survey, partly by Colorado and partly by Wyoming. Some of the gaging stations were in Colorado, but most were in Wyoming. The latter included Woods, nine miles north of the state boundary, and the Pioneer Dam, four miles north of Woods. The evidence centered largely around the flow and gaging at these places. Colorado's chief witness prepared and presented a table based on data, drawn from various sources, and bearing on the flow at Woods from April to October, both inclusive, for several years and made this table the principal basis of his testimony concerning the flow of the stream in that vicinity. We here reproduce the material part of the table, the third and fourth columns being ours.

DISCHARGE OF LARAMIE RIVER, WOODS, WYO.

April to October, both inclusive, for 9 years.

Taken from Colorado's Exhibit 127.

Year.	Acre-feet.	Variance from average.	Variance from average of all but 1899.
1895	220,239	+ 21,694	+ 45,730
1896	108,022	− 90,523	− 66,487
1897	251,074	+ 52,529	+ 76,565
1898	117,765	− 80,780	− 56,744
1899	390,730	+192,185	+216,221
1900	248,105	+ 49,560	+ 73,596
1911	138,240	− 60,305	− 36,269
1912	213,407	+ 14,862	+ 38,898
1913	99,221	− 99,324	− 75,288

Average, 198,533, including all years.
Average, 174,509, excluding 1899.

The data covered two widely separated periods, one of six years and the other of three. The witness took the average of the nine years, which he gave as 198,545 acre-feet, and made this the basis of further calculations. He estimated that the usual flow for the other months was one-tenth of that for the full year, or, putting it in another way, one-ninth of that from April to October, both inclusive; and on this basis he added to his average 21,945 acre-feet, making 220,490. Consulting the Cache la Poudre table, set forth above, he concluded that the nine years, in combination, fell below the full average for the thirty years covered by that table, and to bring the nine years up to a thirty-year average he added 9,510 acre-feet, making 230,000. Some water from Wyoming enters the river between the state boundary and Woods, and for this he deducted 13,000 acre-feet, leaving 217,000. Then, making a reservation as to Sand Creek, to be considered presently, he concluded that 217,000 acre-feet was the average yearly flow in that section of the river. He called it the "normal" flow, an evident misnomer. This did not include water diverted in Colorado, under recognized Colorado appropriations, which does not reach Wyoming.

Even if the computation was to be made along the lines of something approaching a general average, we think the witness's computation and conclusion are subject to objection in particulars which we proceed to state.

The table shows that the flow for 1899 was extraordinary, so much so that it should have been excluded in computing the average and left to take the general level of the others. Its flow was 216,221 acre-feet in excess of their average. The excess added nothing to the available supply,—that which in practice could be used. The flow for the next year was such that it required no augmentation from 1899. So, the inclusion of 1899 in the computation was, in effect, taking what was not available as a

measure of what was. The error raised the average of the other years 24,036 acre-feet, and was carried into the ultimate conclusion.

We do not doubt that it was admissible to compare the data relating to the Laramie with that relating to the Cache la Poudre and to give effect to such conclusions as reasonably were to be drawn from the comparison; but we think there was no justification for the addition which was made to bring the nine years up to the standard of an average year among the thirty covered by the Cache la Poudre table. The addition tended to distort rather than to reflect the available supply. Looking at the Cache la Poudre table, it is evident that the nine years, in combination, would not have appeared short in flow had the four extraordinary years in the thirty been excluded, as they should have been. Besides, a comparison of the two tables shows that the variation in yearly flow in the two streams is not the same and that the difference is such as to preclude a nice calculation such as was here made on the basis of an assumed uniformity. To illustrate: According to one table the flow of the Poudre from April to October, both inclusive, in 1900 was 85,982 acre-feet in excess of that for the same months in 1899, while according to the other the flow of the Laramie for those months in 1899 was 142,625 acre-feet in excess of that for the corresponding period in 1900; and according to one table the flow of the Poudre for those months in 1913 was 73.2 per cent. of that for the same part of 1912, while according to the other the flow of the Laramie for those months in 1913 was 46.5 per cent. of that for the same part of 1912.

Assuming that 13,000 acre-feet enter the river from Wyoming between the state boundary and Woods, and are part of the river at the latter point, we think this water should not have been deducted. It is part of the supply available to satisfy appropriations from the stream in Wyoming.

The witness treated the flow from April to October, both inclusive, in 1912 as being 213,407 acre-feet, and the flow in the same months in 1913 as being 99,221 acre-feet. In this we think he erred. The evidence establishes that the flow in the first period was not more than 191,820 acre-feet and in the second was not more than 94,369. Even with the year 1899 excluded, this error increased the average 3,305 acre-feet.

If we exclude the extraordinary flow of 1899, make the needed correction in the flow of 1912 and 1913, and assume the accuracy of the other data, the average becomes 171,204 acre-feet, instead of 198,545, as given by the witness. This requires that the 21,945 acre-feet which were added to cover the flow for the five other months be reduced to 19,023.

When these corrections are made in the witness's data and computation, the result is changed from 217,000 acre-feet to 190,227.

But we are of opinion that the computation and conclusion of the witness, even when revised in the way we have indicated, are based too much on the average flow and not enough on the unalterable need for a supply which is fairly constant and dependable, or is susceptible of being made so by storage and conservation within practicable limits. By this it is not meant that known conditions must be such as give assurance that there will be no deficiency even during long periods, but rather that a supply which is likely to be intermittent, or to be materially deficient at relatively short intervals, does not meet the test of practical availability. As we understand it, substantial stability in the supply is essential to successful reclamation and irrigation. The evidence shows that this is so, and it is fully recognized in the literature on the subject.

The same witness prepared and submitted another table embodying all the data he was able to secure from records

of past gaging and measurements at Woods. This included three years not shown in the nine-year table. They and their recorded flow from April to October, both inclusive, were: 1889, 132,349 acre-feet; 1890, 168,406 acre-feet, and 1891, 207,146 acre-feet. The witness pronounced the data for these years less accurate than that for the others, and, while his reason for doing so does not clearly appear, we shall assume he was right. Had the three years been included in the nine-year table that would have reduced the average from 198,545 to 189,371 acre-feet, counting all years, and from 174,509 to 171,066 acre-feet, counting all but 1899. It, however, would not have shown another year with a flow as low as that of 1913, nor as low as that of 1896.

Colorado presented other evidence in the way of general estimates, results of very fragmentary gaging, and opinions based on rough measurements of snow-drifts in the mountainous area about the head of the stream; but we put all of this aside as being of doubtful probative value at best and far less persuasive than the evidence we have been discussing.

Wyoming's evidence was based on the same recorded data that were used by Colorado, and also on actual gaging and measurements by an experienced hydrographer covering the period beginning April 1, 1912, and ending April 30, 1914. Shortly stated, her evidence was to the effect that the actual measured flow at the Pioneer Dam, four miles below Woods, was 198,867 acre-feet from April to December, both inclusive, in 1912, was 109,593 acre-feet for all of 1913 and was 19,181 acre-feet for the first four months of 1914; that the flow for 1912 was somewhat above the average, counting all years; that the flow for 1913 was somewhat more than fifty per cent. of the average, and that the average at Woods and in that vicinity, counting all years, was approximately 200,000 acre-feet. Wyoming's chief witness, the hydrographer, submitted

the following table giving the results of his gaging and measurements at the Pioneer Dam.

DISCHARGE OF LARAMIE RIVER AT PIONEER DAM, NEAR WOODS, WYO., (Including diversion just above dam by Pioneer Canal)

IN ACRE-FEET.

	1912	1913	1914
January	.....	2,650	3,283
February	.....	2,355	3,088
March	.....	3,296	4,003
April	5,534	12,674	8,807
May	40,643	38,307	.....
June	91,874	26,598	.....
July	34,863	6,825	.....
August	7,809	3,130	.....
September	4,641	3,023	.....
October	6,456	3,812	.....
November	4,403	3,677	.....
December	2,644	3,246	.....
Total	198,867	109,593	19,181

The evidence does not permit us to doubt the accuracy of these data. They were obtained by work which is shown to have been painstakingly and conscientiously done by one fully competent to do it. The place at which it was done was well adapted to obtaining accurate results and the observations were continuous, not merely occasional or intermittent.

As the gaging did not cover the first three months of 1912, it is necessary to arrive at the flow for those months. The proof shows that the flow for the same months in 1914 fairly may be taken for the purpose. That was 10,374 acre-feet, the addition making 209,241 acre-feet for 1912. The flow for 1913 was 109,593 acre-feet. Both should be increased 4,000 acre-feet to cover water diverted between Woods and the Pioneer Dam and not returning

to the stream above the gaging station. This gives a total of 213,241 acre-feet for 1912 and 113,593 acre-feet for 1913. Tested by the flow of these years, the available supply would be 163,417 acre-feet; that is to say, on that basis the excess in 1912 would match the deficiency in 1913. But a survey of more than two years is essential in arriving at a fair conclusion respecting the available supply. A year of low flow is not always preceded by one of high or moderate flow as was the case with 1912 and 1913.

In diverting and applying water in irrigation there is a material loss through evaporation, seepage and otherwise which is unavoidable. The amount varies according to the conditions,—chiefly according to the distance the water is carried through canals and ditches and the length of time it is held in storage. Where the places of use are in the same watershed and relatively near the stream, as is true of the lands on the Laramie Plains served by the greater part of the Wyoming appropriations, a substantial amount of water percolates back into the stream from irrigated areas and becomes available for further use lower down the stream. This is called return water. The amount varies considerably and there are no definite data on the subject. As respects irrigation on the Laramie Plains above the Wheatland diversion, the evidence satisfies us that the return water will certainly more than counter-balance the loss through evaporation and otherwise when the period of storage is not more than from one year to the next.

What has now been said covers the substance of the evidence, as we regard it, bearing on the available supply at Woods and in that vicinity, that is to say, the supply remaining after the recognized Colorado appropriations are satisfied.

We already have indicated that, as to such a stream as this, the average flow of all years, high and low, cannot

be taken as a proper or reasonable measure of what is available for practical use. What then is the amount which is available here? According to the general consensus of opinion among practical irrigators and experienced irrigation engineers, the lowest natural flow of the years is not the test. In practice they proceed on the view that within limits, financially and physically feasible, a fairly constant and dependable flow materially in excess of the lowest may generally be obtained by means of reservoirs adapted to conserving and equalizing the natural flow; and we regard this view as reasonable.

But Wyoming takes the position that she should not be required to provide storage facilities in order that Colorado may obtain a larger amount of water from the common supply than otherwise would be possible. In a sense this is true; but not to the extent of requiring that the lowest natural flow be taken as the test of the available supply. The question here is not what one State should do for the other, but how each should exercise her relative rights in the waters of this interstate stream. Both are interested in the stream and both have great need for the water. Both subscribe to the doctrine of appropriation, and by that doctrine rights to water are measured by what is reasonably required and applied. Both States recognize that conservation within practicable limits is essential in order that needless waste may be prevented and the largest feasible use may be secured. This comports with the all-pervading spirit of the doctrine of appropriation and takes appropriate heed of the natural necessities out of which it arose. We think that doctrine lays on each of these States a duty to exercise her right reasonably and in a manner calculated to conserve the common supply. Notwithstanding her present contention, Wyoming has in fact proceeded on this line, for, as the proof shows, her appropriators, with her sanction, have provided and have in service reservoir facilities which are adapted for the

purpose and reasonably sufficient to meet its requirements.

There is one respect, requiring mention, in which Colorado's situation differs materially from that of Wyoming. The water to satisfy the Colorado appropriations is, and in the nature of things must be, diverted in Colorado at the head of the stream; and because of this those appropriations will not be affected by any variation in the yearly flow, but will receive their full measure of water in all years. On the other hand, the Wyoming appropriations will receive the water only after it passes down into that State and must bear whatever of risk is incident to the variation in the natural flow. Of course, this affords no reason for underestimating the available supply, but it does show that to overestimate it will work particular injury to Wyoming.

The lowest established flow was that of 1913. There is no claim or proof that in any other year the flow fell so low. Had there been others some proof of it doubtless would have been presented. This is also true of the very low flow of 1896. Therefore we think it reasonably may be assumed that the flow of those years was so exceptional that it is not likely to recur save at long intervals.

We conclude in view of all the evidence, and of the several considerations we have stated, that the natural and varying flow of this stream at Woods, which is after the recognized Colorado appropriations are satisfied, is susceptible by means of practicable storage and conservation of being converted into a fairly constant and dependable flow of 170,000 acre-feet per year, but not more. This we hold to be the available supply at that point after the recognized Colorado diversions are made. The amount may seem large, but, considering what may be accomplished with practicable storage facilities, such as are already provided, and the use which may be made of

the return water, we are persuaded that the amount, while closely pressing the outside limit, is not too large.

The problem to be worked out in obtaining a fairly dependable supply in that amount is measurably illustrated by the following table covering all the years for which the evidence supplies the requisite data, the flow during the missing months being fairly estimated.

Year.	Acre-feet.	Variance from average of all.	Variance from average of all but 1899.	Variance from 170,000.
1889	151,349	−56,893	−38,576	−18,651
1890	187,406	−20,836	−2,519	+17,406
1891	226,146	+17,904	+36,221	+56,146
1895	239,239	+30,997	+49,314	+69,239
1896	127,022	−81,220	−62,903	−42,978
1897	270,074	+61,831	+80,149	+100,074
1898	136,765	−71,477	−53,160	−33,235
1899	409,730	+201,488	+219,805	+239,730
1900	267,105	+58,863	+77,180	+97,105
1911	157,240	−51,002	−32,685	−12,760
1912	213,241	+4,999	+23,316	+43,241
1913	113,593	−94,649	−76,332	−56,047

Average 208,242, including all years.
Average 189,925, including all years but 1899.

It of course is true that the variation in the flow will not always be just what it was in the years covered by the table, and yet the data obtained by the gaging and measurements in those years show better than anything else what reasonably may be expected in the future. We recognize that the problem which the table is intended to illustrate is not a simple one and that to work it out will involve the exercise of both skill and care. But in this it is not unlike other problems of similar moment. Our belief gathered from all the evidence is that, with the attention which rightly should be bestowed on a problem of such moment, it can be successfully solved within the limits of what is financially and physically practicable.

As to Sand Creek, Colorado's witness regarded it as a tributary of the river and estimated its yearly flow at 17,000 acre-feet. The creek rises in Colorado, extends into the Laramie Plains in Wyoming and discharges into Hutton Lake, a few miles from the river. In exceptional years—about one in five—the waters of the creek overflow the lake for a short period and find their way over the prairie into the river. Otherwise the river receives no water from the creek. The proof of this is direct and undisputed. The creek is nominally a tributary of the river, but only that. Besides, its flow does not appear to have been measured. The witness merely estimated it at what he thought would be the natural run-off of the adjacent territory. Other evidence suggests that the estimate is too high, but this we need not consider. A substantial part of the flow is diverted, through what is known as the Divide Ditch, for use in irrigating lands in Colorado, and the evidence suggests, if it does not establish, that existing appropriations in the two States take the entire flow. For these reasons the waters of this creek cannot be regarded as a factor in this controversy.

After passing Woods, and while traversing the territory wherein are the Wyoming appropriations with which we are concerned, the Laramie receives one large and some very small additions to its waters.

The large addition comes from the Little Laramie, a stream whose source and entire length are in Wyoming. Its natural flow is a little more than one-half of that of the main stream at Woods and is subject to much the same variations. Part of its flow is used under appropriations along its course and the remainder passes into the main stream. Including what is appropriated along its course, and excluding minor contributions by small creeks after it gets well away from its headwaters, we think the amount available for practical use is 93,000 acre-feet per year.

None of the small tributaries, whether of the Laramie or the Little Laramie, adds much to the available supply.

Their natural flow is small. As to some it is all used under old appropriations; as to some it is partly used under such appropriations; and as to some it is only seasonal, the channels being dry much of the year. Some creeks spoken of in Colorado's evidence as tributaries are otherwise shown not to be such, but to deliver their waters into lakes or ponds not connected with either of the principal streams. Colorado's evidence also takes into account some tributaries which discharge into the Laramie below the points of diversion of all the Wyoming appropriations with which we are concerned. One, of which much is said in the evidence, is the Sybille. It reaches the Laramie below the diversion for the Wheatland District (the lowest diversion we are to consider), but in its course passes through that district. A small part of its flow is used in that district and it is not practicable to use more. What is used should, for present purposes, be treated as if it reached the Laramie above the Wheatland diversion. Wyoming contends that none of these small tributaries, other than the Sybille, contributes any dependable amount to the available supply. We think there is in the aggregate a fairly dependable contribution of 25,000 acre-feet, but not more.

It results that, in our opinion, the entire supply available for the proposed Colorado appropriation and the Wyoming appropriations down to and including the diversion for the Wheatland District is 288,000 acre-feet.

In contending for a larger finding, Colorado points to the issue by Wyoming's State Engineer of permits, so-called, for appropriations in excess of that amount and insists that these permits constitute solemn adjudications by that officer that the supply is adequate to cover them. But in this the nature of the permits is misapprehended. In fact and in law they are not adjudications, but mere licenses to appropriate, if the requisite amount of water be there. As to many nothing ever is done under them by

the intending appropriators. In such cases there is no appropriation; and even in others the amount of the appropriation turns on what is actually done under the permit. In late years the permits relating to these streams have contained a provision, saying: "The records of the State Engineer's office show the waters of [the particular stream] to be largely appropriated. The appropriator under the permit is hereby notified of this fact, and the issuance of this permit grants only the right to divert and use the surplus or waste water of the stream and confers no rights which will interfere with or impair the use of water by prior appropriators." It therefore is plain that these permits have no such probative force as Colorado seeks to have attributed to them.

Colorado also comments on the amount of water stored in Wyoming reservoirs in 1912 and seeks to draw from this an inference that the available supply was greater than we have indicated. But the inference is not justified, and for these reasons: First, a part of what was stored was dead water, that is, was below the level from which water could be drawn off and conducted to the places of use. This is a matter commonly experienced in the selection and use of reservoir sites. Secondly, the flow of 1912 was above what could be depended on and prudence required that a substantial part be carried over to meet a possible shortage in the succeeding year. And, thirdly, the evidence shows that in 1912 the storing process was improvidently carried to a point which infringed the rights of small appropriators who were without storage facilities.

The available supply—the 288,000 acre-feet—is not sufficient to satisfy the Wyoming appropriations dependent thereon and also the proposed Colorado appropriation, so it becomes necessary to consider their relative priorities.

There are some existing Colorado appropriations having priorities entitling them to precedence over many of the

Wyoming appropriations. These recognized Colorado appropriations are, 18,000 acre-feet for what is known as the Skyline Ditch and 4,250 acre-feet for the irrigation of that number of acres of native-hay meadows in the Laramie valley in Colorado, the 4,250 acre-feet being what Colorado's chief witness testifies is reasonably required for the purpose, although a larger amount is claimed in the State's answer. These recognized Colorado appropriations, aggregating 22,250 acre-feet, are not to be deducted from the 288,000 acre-feet, that being the available supply after they are satisfied. Nor is Colorado's appropriation from Sand Creek to be deducted, that creek, as we have shown, not being a tributary of the Laramie.

The proposed Colorado appropriation which is in controversy here is spoken of in the evidence as the Laramie-Poudre tunnel diversion and is part of an irrigation project known as the Laramie-Poudre project. Colorado insists that this proposed appropriation takes priority, by relation, as of August 25, 1902, and Wyoming that the priority can relate only to the latter part of 1909. The true date is a matter of importance, because some large irrigation works were started in Wyoming between the dates mentioned, were diligently carried to completion, and are entitled to priorities as of the dates when they were started.

The Laramie-Poudre project is composed of several units, originally distinct, which underwent many changes before they were brought together in a single project. In its final form the project is intended to divert water by means of a tunnel from the Laramie River into the Poudre watershed, there to unite that water with water taken from the Cache la Poudre River and then to convey the water many miles to the lower part of the Poudre valley, where it is to be used in reclaiming and irrigating a body of land containing 125,000 acres. It is a large and ambitious project whose several parts, as finally brought

together, are adjusted to the attainment of that purpose. The parts were separately conceived, each having a purpose of its own. The project now is intended to draw on two independent sources of supply, each in a separate watershed.[1] The appropriations are necessarily distinct. Neither adds anything to, nor substracts anything from, the status of the other. We are concerned with only one of them.

The proposed tunnel diversion from the Laramie was conceived as a possibility by Wallace A. Link in 1897 and was explained by him to Abraham I. Akin in the spring of 1902. Later in the year they visited the headwaters of the two streams, looked over the ground, and agreed that Link's idea was a good one, that the undertaking was large and that they were without the means to carry it through. They concluded to promote the project together; and, thinking their chances of success would be improved by it, they also concluded to construct a ditch, known as the Upper Rawah, from the Laramie valley to a connection with an existing ditch, called the Skyline, and to take water through these ditches into the Cache la Poudre valley and there sell it. By this they hoped to demonstrate that water was obtainable from that source and to obtain money to be used in promoting their project. The Skyline was a fair-sized ditch leading over a low part of the divide to a branch of the Poudre, and they

[1] An engineer who had been connected with the work, and was a witness for the defendants, said: "This system has two distinct and independent sources of supply; that from the Laramie River and that from the Poudre River basin and the tributaries of the South Platte, and it was so designed that the Poudre Valley Canal could divert water from the Poudre River and also from the northern tributaries of the Poudre intercepted by the canal and from the tributaries of the South Platte as far east as Crow Creek and intercepted by the canal wherever there was surplus water. We estimated that the amount of water available outside of the Laramie River source would be between 80,000 and 100,000 acre-feet per annum as an average."

arranged with its owner for the carriage, on a percentage basis, of water from their ditch when constructed. They also conceived that the ditch could be used advantageously in collecting and carrying water to be sent through the tunnel, if and when the tunnel diversion was effected. In 1902, beginning August 25, they surveyed the line of the Rawah and in October of that year filed a statement of claim under it in the State Engineer's office. In the statement they said nothing about a tunnel diversion and made claim only to the amount of water expected to be carried through the Rawah and to the use of certain lakes or natural reservoirs for storage purposes. No work was done on the ditch that year. In 1903 they cleared some of the land over which it was to run, but did no excavating. In 1904 they constructed 6,000 feet of the ditch and did more clearing. No work was done on it in 1905 or 1906. Further work was done in 1907 and some washouts were repaired in 1908. That was the last work on the Rawah. Much more than one-half of the ditch was left unconstructed. No water was delivered through it to the Skyline, nor was any sold or used. Nothing appears to have been done with the lakes or natural reservoirs.

In 1903 Link and Akin gave to each of three others a one-fifth share in their project, in return for which the new partners were to carry on solicitations to get capitalists interested and to raise money. The results of the solicitations were disappointing, but some investors were brought in and became concerned about the preliminary plans. Differences of opinion arose and had to be dealt with. The plans were examined and reëxamined, alternative modes and places of diversion were considered and investigated, particular features were eliminated and others added, and in 1909, but not before, the project was definitely brought into its present form. A short reference to some of the details will serve to make this plain.

In the Upper Rawah filing of October, 1902, nothing was said about the proposed tunnel diversion, but a claim was made to the use of certain lakes or natural reservoirs described as having an aggregate capacity of 325,000,000 cubic feet. The tunnel diversion was merely a mental conception until 1904. In March of that year a survey was made of a tunnel site, a ditch from the west fork of the Laramie to the east fork, and a channel reservoir on the east fork above the tunnel site; and in May following a statement of claim under them was filed, in which the estimated cost of the tunnel and ditch was given as $189,200 and that of the reservoir as $20,000. Later in 1904 a survey was made of a tunnel site, three collecting ditches and two pipe lines, and in October of that year a statement of claim under them was filed, in which the estimated cost of the tunnel, ditches and pipe lines was given as $375,000. The location and dimensions of the tunnel in the second survey differed from those in the first. The difference was not pronounced, and yet was a real change. In September, 1906, another statement of claim was filed covering the Upper Rawah Ditch, the lakes connected therewith and the tunnel. This statement declared that the lakes were to be so enlarged that they would have an aggregate capacity of 1,250,000,000 cubic feet, instead of 325,000,000 as stated in the filing of 1902; and it again changed the location and dimensions of the tunnel,—this time more than before.

In 1905 and 1906 surveys were made to find a route for an open canal from the Laramie around the mountains, through a portion of Wyoming and back to Colorado, which would avoid the construction of a tunnel and the maintenance of ditches in the higher mountain levels; and in 1908 a statement of claim covering such a canal was filed, as was also a claim covering a large channel reservoir nine miles down the stream from the tunnel site. The estimated cost of the canal was given as $1,000,000

and that of the reservoir as $200,000. The plan evidenced by these filings was that of impounding the water in the reservoir and liberating it in an equalized flow into the canal, which was to carry it into the Poudre watershed without the aid of a tunnel. Late in 1908 and in the fore part of 1909 another survey along the same general line and with the same purpose was made at a cost of $15,000. Early in 1909 a statement of claim was filed covering a proposed reservoir near the tunnel site, the cost being estimated at $200,000.

In 1907 the Laramie-Poudre Reservoirs and Irrigation Company succeeded to whatever rights the promoters had acquired up to that time, and all subsequent surveys, investigations and filings were made by it. In April, 1909, the Greeley-Poudre Irrigation District, within which the water is intended to be used, was organized. At that time sufficient capital had not been obtained to carry the project through in any form. In September following the irrigation company and the irrigation district entered into a tentative contract, under which the company was to consummate the project in its present form, and, after doing the construction work, was to transfer the property to the district. Payment therefor was to be made in interest-bearing bonds of the district. By a vote taken the next month, the district ratified the contract and authorized the issue of the bonds. About the last of that month the work of boring the tunnel and making the diversion was begun.

It is manifest from this historical outline that the question of whether, and also how, this proposed appropriation should be made remained an open one until the contract with the irrigation district was made and ratified in 1909. Up to that time the whole subject was at large. There was no fixed or definite plan. It was all in an inceptive and formative stage,—investigations being almost constantly in progress to determine its feasibility and

whether changes and alternatives should be adopted rather than the primary conception. It had not reached a point where there was a fixed and definite purpose to take it up and carry it through. An appropriation does not take priority by relation as of a time anterior to the existence of such a purpose.

It no doubt is true that the original promoters intended all along to make a large appropriation from the Laramie by some means, provided the requisite capital could be obtained, but this is an altogether inadequate basis for applying the doctrine of relation.

No separate appropriation was effected by what was done on the Upper Rawah Ditch. The purpose to use it in connection with the Skyline was not carried out, but abandoned. This, as Link testified, was its "principal" purpose. The purpose to make it an accessory of the large project was secondary and contingent. Therefore the work on it cannot be taken as affecting or tolling back the priority of that project.

Actual work in making the tunnel diversion was begun as before shown, about the last of October, 1909. Thereafter it was prosecuted with much diligence and in 1911, when this suit was brought, it had been carried so nearly to a state of completion that the assumption reasonably may be indulged that, but for the suit, the appropriation soon would have been perfected. We conclude that the appropriation should be accorded a priority by relation as of the latter part of October, 1909, when the work was begun.

Applying a like rule to the Wyoming appropriations, several of them must be treated as relating to later dates, and therefore as being junior to that appropriation. Some of the projects in that State are founded on a plurality of appropriations, a part of which are senior and a part junior to that one.

The evidence shows that the Wyoming appropriations having priorities senior to the one in Colorado, and which

are dependent on the available supply before named, cover 181,500 acres of land and that the amount of water appropriated and reasonably required for the irrigation of these lands is 272,500 acre-feet. A much larger amount is claimed, but our finding restricts the amount to what the evidence shows is reasonably required, which is one acre-foot per acre for the larger part of the lands, two acre-feet per acre for a part and two and one-half acre-feet per acre for the remainder.

As the available supply is 288,000 acre-feet and the amount covered by senior appropriations in Wyoming is 272,500 acre-feet, there remain 15,500 acre-feet which are subject to this junior appropriation in Colorado. The amount sought to be diverted and taken under it is much larger.

A decree will accordingly be entered enjoining the defendants from diverting or taking more than 15,500 acre-feet per year from the Laramie River by means of or through the so-called Laramie-Poudre project.

It is so ordered.

STATE OF WYOMING *v.* STATE OF COLORADO ET AL.

IN EQUITY.

No. 3, Original. Final decree entered June 5, 1922.

This cause having been heretofore submitted on the pleadings and the evidence taken before and reported by the commissioners appointed for the purpose, and the court being now fully advised in the premises:

It is considered, ordered and decreed that the defendants, their officers, agents and servants, be, and they are hereby, severally enjoined from diverting or taking from the Laramie River and its tributaries in the State of Colo-

rado more than fifteen thousand five hundred (15,500) acre-feet of water per annum in virtue of or through what is designated in the pleadings and evidence as the Laramie-Poudre Tunnel appropriation in that State,

Provided, that this decree shall not prejudice the right of the State of Colorado, or of any one recognized by her as duly entitled thereto, to continue to exercise the right now existing and hereby recognized to divert and take from such stream and its tributaries in that State eighteen thousand (18,000) acre-feet of water per annum in virtue of and through what is designated in the pleadings and evidence as the Skyline Ditch appropriation in that State; nor prejudice the right of that State, or of any one recognized by her as duly entitled thereto, to continue to exercise the right now existing and hereby recognized to divert and take from such stream and its tributaries in that State four thousand two hundred and fifty (4,250) acre-feet of water per annum in virtue of and through the meadow-land appropriations in that State which are named in the pleadings and evidence; nor prejudice or affect the right of the State of Colorado or the State of Wyoming, or of any one recognized by either State as duly entitled thereto, to continue to exercise the right to divert and use water from Sand Creek, sometimes spoken of as a tributary of the Laramie River, in virtue of any existing and lawful appropriation of the waters of such creek;

And it is also considered, ordered and decreed that the State of Wyoming do have and recover from the defendants her lawful costs herein.

And it is further considered, ordered and decreed that the clerk of this court do transmit to the chief magistrates of the States of Colorado and Wyoming copies of this decree duly authenticated under the seal of this court.[1]

[1]A modified decree was entered October 9, 1922. It will be printed in Vol. 260 U. S., p. 1.
